INTRODUCTION:

Multitenancy in WebLogic Server provides a sharable infrastructure for use by client organizations (tenants). By allowing one domain to support multiple tenants, WLS MT improves density and achieves a more efficient use of resources while eliminating the trade-offs that are traditionally made in a shared environment: Isolation issues. Multitenancy essentially creates the tension between isolation and sharing. Isolation separates both the administration and runtime of different tenants from each other, where resource sharing among tenants improves efficiency and reduces operation costs.

Domain Partition:

WebLogic Server MT provides resource isolation with in domain partitions, an administrative and runtime slice of a WebLogic domain that is dedicated to running application instances and related resources for a tenant. Domain Partition achieve greater density by allowing application instances and related resources to share the domain, WebLogic Server itself, the Java virtual machine, and the operating system while isolating tenant specific application data, configuration, and runtime traffic. Each domain partition has its own runtime copy of the application and resources.

Resource Groups:

WLS MT introduces resource groups, simply as a convenient way to group together Java EE applications and the resources they use into a distinct administrative unit within the domain. The resources and applications are “fully qualified” in that administrator provides all information needed to start or connect to those resources, including credentials for connecting to data source and targeting information for Java EE application. A resource group will either contain these deployable resources directly or refer to a resource group templates which contain the resources. Resource group can be defined at the domain level, or be specific to domain partition.

All the resources in or referenced by a resource group are targeted together (to the same target). Resource group can be started and stopped.

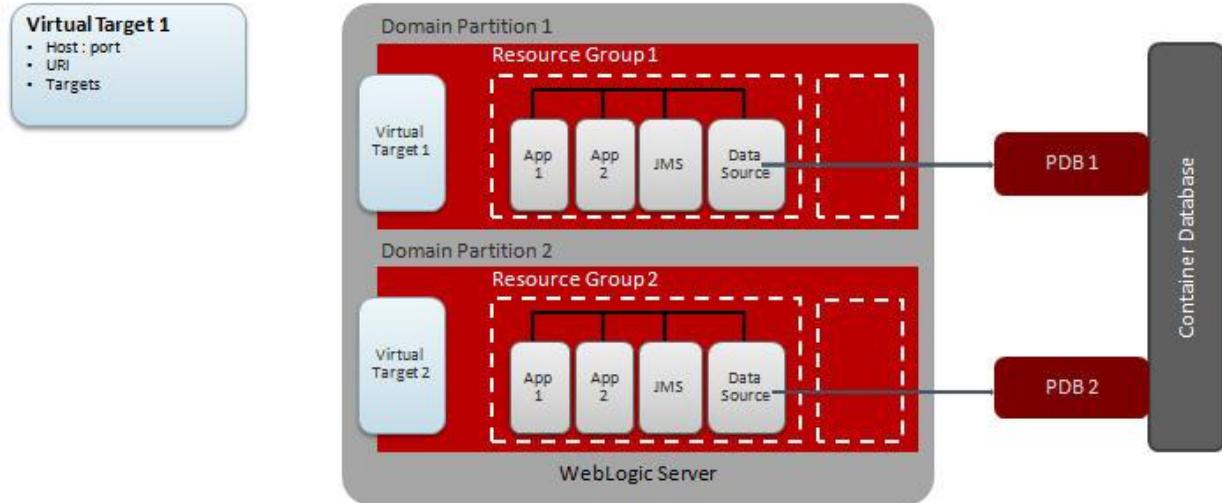

Virtual Target:

Encapsulate where a partition or resource group runs and how to route traffic to them, including addresses, protocol settings, and targeting, Request routing is determined by the host name and optional URI.

May Include:-

- Host name and port
- Optional URI
- Network Access Point or Channel
- Protocol specific configuration
 - T3, IIOP
 - Web Server
- Target Clusters and managed servers

In Multitenant environment, We create Virtual Target first, In previous versions of WebLogic Server, We Targeted our application, system resources (JDBC or JMS Resources) to Clusters, Managed Servers part of Cluster or stand alone managed server. But here we target our resources to Virtual Target. After creation of Virtual Target, we create a domain partition, while creating domain partition we can create resource group. A domain partition can have multiple resource groups. Then we target domain partition to the Virtual Target. Below diagram gives you the picture how they work together.

As in the Above Diagram, We created Virtual target 1, Virtual Target 2 which are Targeted to WebLogic Server. Then we created Two Domain partitions, Domain partition 1 has Resource Group 1 and Domain Partition 2 has Resource Group 2.

To know more about the Multitenancy, you can follow the link [here](#).

We have total 6 Labs; the brief information about each lab is given below.

Lab 1 consist Non MT configuration, in this Lab we create basic configuration required for each lab. First we create **base_domain** using the **Restricted-JRF** template. This is the domain we are using in each lab. Using the Fusion Middleware Control Console, we will create machine and one dynamic cluster of initial size of two managed server inside it.

Lab 2 consist creation of MT configuration, in which we creates virtual target, domain partition and resource group. We show you can easily deploy one application twice in a domain in different domain partition. In this case both applications will be connected to different database. Good thing is that you don't need to modify the application deploying to different domain partition because we have JNDI isolation. We also use day trader application which is build by IBM, we made few changes in the application to run the application in Non MT environment, and we took the same application to deploy in MT environment (inside domain partition). So you don't need any specific application development to deploy the application in Multitenant environment.

Lab3 shows how you can have two or more security realms active inside a domain. Traditionally in WebLogic server, we have more than one Security realm but only one is active for the domain. Here, we have multiple domain partition, so you can have separate security realm for each domain partition. In Lab 2 we deploy Medrec application in domain partition dp1 and dp2. As while creating domain partition dp2 we do not choose any security realm so it uses the default security realm. In Lab 3 we create a new security realm and assign it to domain partition dp1. So both domain partitions will have different set of authorized user.

Lab 4 shows how you can easily move domain partition from one environment to another environment. Generally we work in simple development environment, like no restricted JRF, no cluster. But we need to test our application in testing environment, run in production environment. In Lab 4 we create a dev_domain using a by default templates and it consist only admin server. We do the required configuration for Medrec Application in dev_domain, once we have Medrec application is deployed in domain partition Medrec-Dev in dev_domain, we export the domain and import it in base_domain.

Lab 5 shows how you can configure the resource configuration manager. As the domain partition is targeted to the Virtual target which is targeted to a cluster. So multiple domain partition may be using the same cluster, in that scenario to avoid one partition to use the resources excessively, we set the limit using resource configuration management, we specify the limit for notify, slow and shutdown action. As the resource uses reaches that limit, particular action happens.

Lab 6 shows how you can integrate OTD as a front end in domain partition. It shows the steps how to integrate OTD while creating the domain partition. This Lab also shows you the Resource group migration from one cluster to other cluster. As OTD is front ending your domain partition, so without any interruption you can access the application using the same URL.

You create three domains as part of this workshop. There role are as given:

base_domain: We create this domain as part of Lab 1. This is the main domain which we are using in each lab. We create machine, dynamic cluster and domain partitions.

dev_domain: We create this domain as part of Lab 4. This domain uses default template and contain Admin Server only. This domain represent domain which we generally uses for development purposes. We create a domain partition Medrec-Dev inside it, which we later export and import it to base_domain.

otd_domain: We create this domain as part of Lab 6. This domain consist Admin Server, and Load Balance instance.

How to Use Individual Labs:

Lab 1 and Lab 2 are compulsory.

Lab 3: You need to run Lab 1 and Lab2 before executing Lab 3.

Lab 4: You need to run Lab 1 and Lab 2 before executing Lab 4.

Lab 5: You need to run Lab 1 and Lab 2 compulsory for it. And if you do not execute Lab 4 before running Lab 5, then instead of modifying the changes to Medrec-Dev domain, you need to modify the domain partition dp1.

Lab 6: You need to run Lab 1 before executing the Lab 6.

Virtual Box Environment

The Hands on Lab Environment

Operating System Details

Operating System	Oracle Linux 6.4 x86_64
Hostname	localhost, wins-vbox
Root User	root/oracle
Oracle User	oracle/welcome1

Note: For this hand on lab you should only need to use **oracle** user account.

Installation Directories

JDK 1.8.0_60	/usr/java/jdk1.8.0_60/
WebLogic Server 12.2.1	/u01/wins/wls1221/
Oracle Traffic Director 12.2.1	/u01/wins/wls1221/
Oracle Database 12c	/u01/app/oracle/product/12.1.0/dbhome_1/

----------------	---

LAB 1: DOMAIN CREATION AND NON-MT CONFIG

Overview

In this lab, we are going to perform the below operations.

- We create a WebLogic domain, in that domain we create machine, dynamic cluster.

Start the database

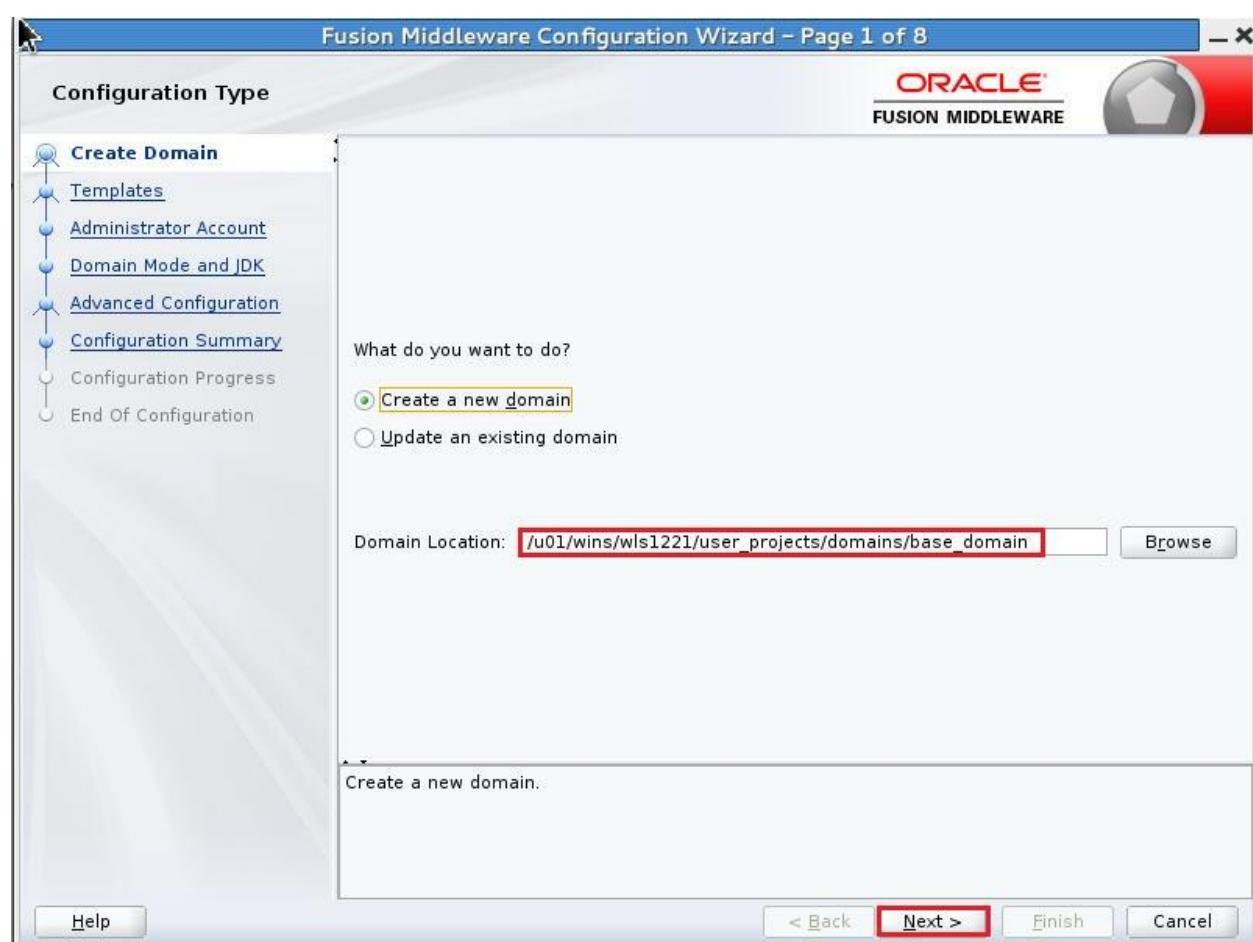

We have two Pluggable database **pdborcl** and **pdb2**; we are going to start both the database.

- a. In Desktop, Double Click on Icon “**Start Database**”.

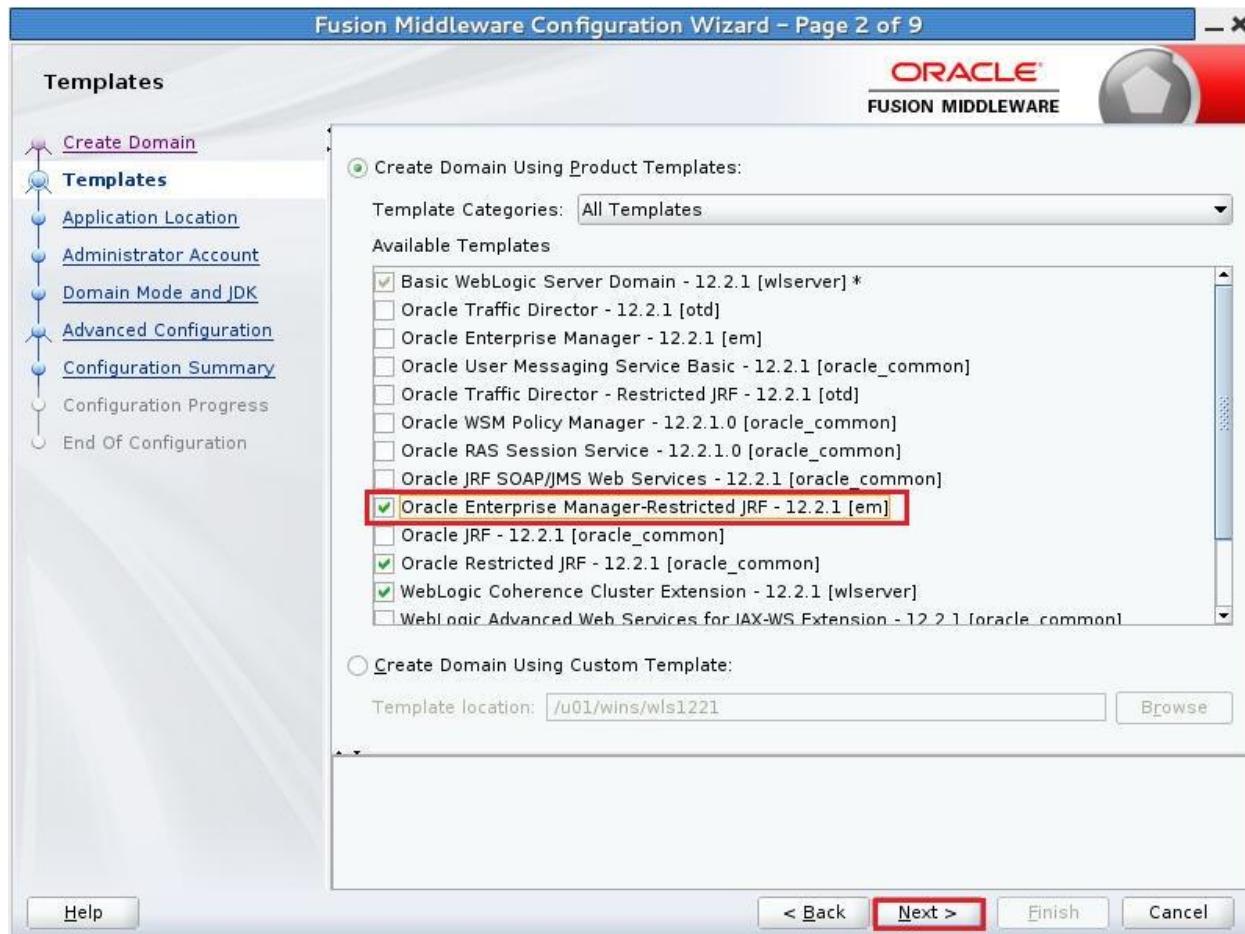

Note: Wait until the Window disappears.

Create WebLogic Restricted JRF Domain

- a. Open a new terminal.
- b. cd /u01/wins/wls1221/oracle_common/common/bin/
- c. ./config.sh
- d. Select “**Create a new domain**” and Enter
“/u01/wins/wls1221/user_projects/domains/base_domain” as Domain Location then click on **Next**.

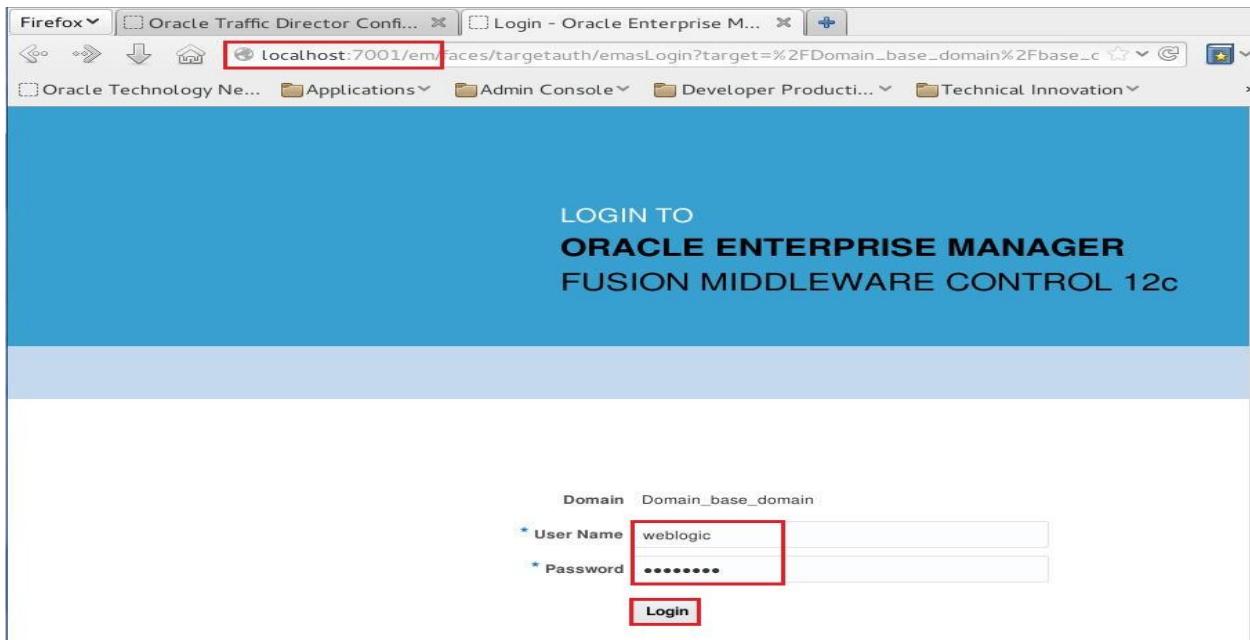

- e. Select “**Oracle Enterprise Manager –Restricted JRF-12.2.1 [em]**” as it also select the remaining required check boxes then click on **Next**.

- f. Leave Default on **Application Location** then click on **Next**.
g. Enter **weblogic/welcome1** as Name/Password then click on **Next**.
h. Leave Default on **Domain Mode and JDK Screen** then click on **Next**.
i. Leave Default on **Advanced Configuration** then click on **Next**.
j. Click on **Create**.
k. Click on **Next** then click on **Finish**.

Configuration of WebLogic base_domain

- a. cd /u01/wins/wls1221/user_projects/domains/base_domain/bin/
- b. ./startNodeManager.sh
- c. In tab, Click on **Terminal -> Set Title**. Enter **base_nm** as Title then click on OK.
- d. Open a new tab.
- e. cd /u01/wins/wls1221/user_projects/domains/base_domain/bin/
- f. ./startWebLogic.sh
- g. In tab, Click on **Terminal -> Set Title**. Enter **base_admin** as Title then click on OK.
- h. Go back to Firefox and type the Fusion Middleware Control URL <http://localhost:7001/em>
- i. Enter **weblogic/welcome1** as **username/password** then click on **Login**.

- j. Create a Machine.
 - i. Click on **WebLogic Domain-> Environment -> Machine**.
 - ii. Click on **Create**.
 - iii. Enter “**machine**” as Name, Select “**Unix**” as Machine OS, then click on **Next**.
 - iv. Leave Defaults on Node Manager Properties then click on **Create**.
 - v. Click on the Machine name **machine**.
 - vi. Click on **Monitoring** tab and verify the status as **Reachable**.

k. Create a Dynamic Cluster

- Click on **WebLogic Domain -> Environment -> Clusters.**

The screenshot shows the Oracle Enterprise Manager interface. The left sidebar has three main categories: Server, Cluster, and Deployment. Under the Cluster category, the 'Environment' link is highlighted with a red box. The main content area shows a 'Domain Server' configuration with fields: Name (AdminServer), Host (localhost), and Port (7001). A dropdown menu is open under 'Environment' with the 'Clusters' option highlighted with a red box. To the right is a table titled 'Clusters' with columns: Cluster, Machine, and State. One row is visible with the state 'Running'. At the bottom right of the table, it says 'Servers 1 of 1'. The top right corner shows the date and time: Nov 5, 2015 2:10:29 AM PST.

- Click on **Create -> Dynamic Cluster.**

The screenshot shows the 'Clusters' creation page. The top navigation bar includes 'View', 'Create' (with 'Dynamic Cluster' highlighted with a red box), 'Delete', 'Control', and 'Scale Up/Down'. The main table has columns: Name, Cluster, Cluster Type, Servers, Cluster Messaging Mode, Default Load Algorithm, Replication Type, Multicast Address, and Multicast Port. A sub-table under 'Cluster' shows 'Dynamic Cluster'. Below the table, it says 'No clusters found'.

- Enter **app-cluster** as Name then click on **Next.**

- Leave Default on **Dynamic Server Properties** page and click on **Next.**

- v. Select “Use a single machine for all dynamic servers” and choose the **machine**, then click on **Next**.

Create a Dynamic Cluster: Machine Bindings

Use this page to associate dynamic servers with machines.

How do you want to distribute dynamic servers across machines?

Use any machine configured in this domain
 Use a single machine for all dynamic servers
Selected Machine: machine

Use a subset of machines in this domain

Machine Name Match Expression

- vi. Leave Default on Listen Port Bindings, and then click on **Next**.
vii. Review the Configuration and click on **Create**.

- I. Start Managed Servers.
i. Click on **WebLogic Domain -> Control ->Clusters**.

base_domain

WebLogic Domain

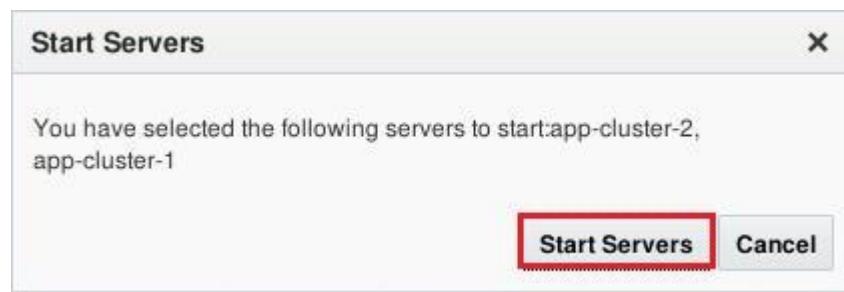

- Control
- Servers
- Clusters
- Deployments
- JDBC Data Sources
- Messaging
- Cross Component Wiring
- Web Services
- Other Services
- Administration
- Refresh WebLogic Domain
- Security

Clusters

Admin Server Port	Username	OTD Domain
8001	weblogic	otd_domain

- ii. Check the box near to **app-cluster** to make it highlighted and then Click on **Control -> Start -> Start Servers**.

The screenshot shows the Oracle Enterprise Manager Fusion Middleware Control 12c interface. The title bar reads "ORACLE Enterprise Manager Fusion Middleware Control 12c". The top navigation bar includes "WebLogic Domain" and "weblogic", with "Auto Refresh" set to "Off". The date and time are shown as "Nov 5, 2015 2:26:48 AM PST". The main content area is titled "Clusters (Control)". A pie chart indicates "Down (1)" status. Below it is a table with columns: Name, Cluster Type, Servers, Cluster Messaging Mode, Default Load Algorithm, and Replication Type. One row is selected, showing "app-cluster" in the Name column, "Dynamic" in Cluster Type, "2" in Servers, "Unicast" in Cluster Messaging Mode, "Round Robin" in Default Load Algorithm, and "(None)" in Replication Type. A context menu is open over the "app-cluster" row, with the "Start" option highlighted by a red box. Other options in the menu include "Resume", "Suspend", "Shutdown", and "Restart SSL". The bottom of the screen shows "Rows Selected 1" and "Columns Hidden 32".

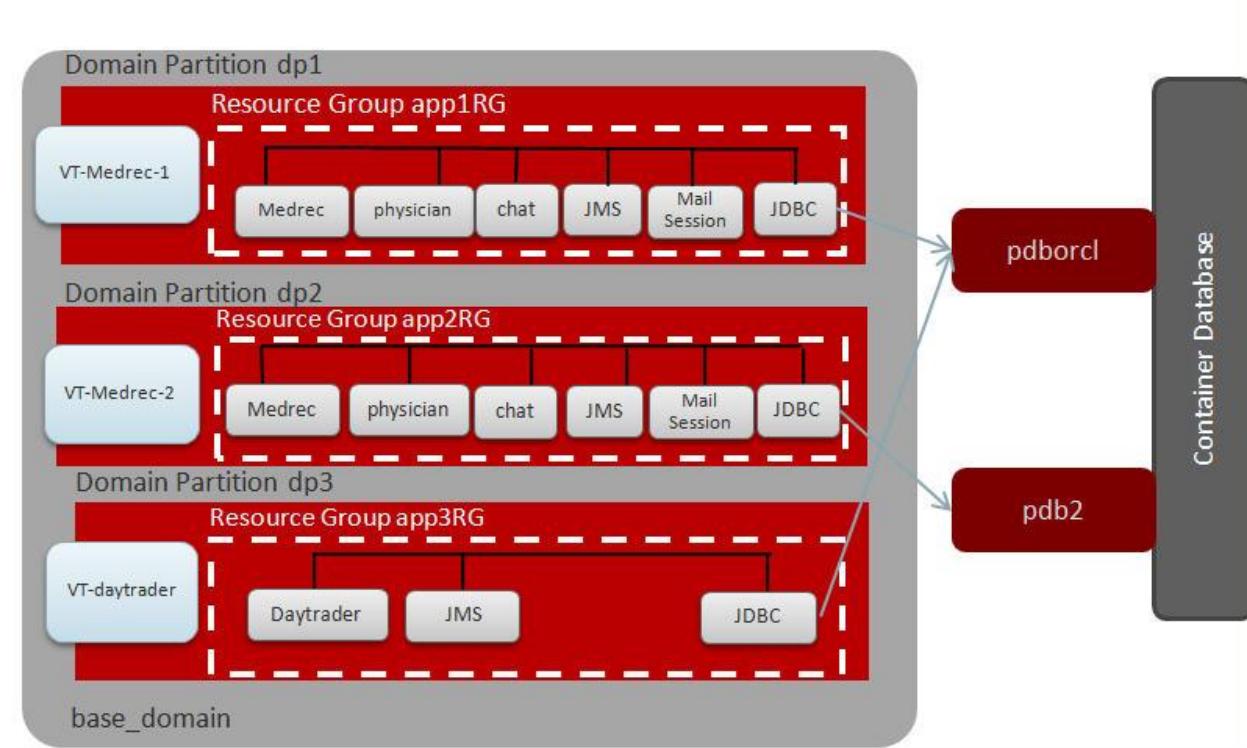

LAB 2: MULTITENANCY CONFIGURATION

Overview:

In this lab, we are going to learn the following:

- Configuration of Virtual Target, Domain Partition and Resource Group
- Run multiple instances of Medrec application in different domain partition without modifying the application. We try to show **JNDI Isolation** for that we are using the same Medrec applications and same JNDI name for the Datasources, connection factory and Distributed queue in both the domain partition.
- Run Day trader application which is build by WebSphere to WebLogic 12.2.1.
- You don't need to modify your application to run in Multitenant environment. So no special application development needed.

The final deployment architecture will look like the below where we will create three domain partitions . Deploy Medrec application in domain partition dp1 and dp2. And Day Trader application on domain partition dp3.

Configuration of Medrec Application in Domain Partition 1

In the next step we are creating the below configuration for Medrec application in domain partition dp1.

Virtual Target: VT-Medrec-1

Domain Partition: dp1

Resource Group app1RG

app1RG:

Datasource:

Name: MedRecGlobalDataSourceXA

JNDI Name: jdbc/MedRecGlobalDataSourceXA

Mail Session:

Name: MedRecMailSession

JNDI Name: mail/MedRecMailSession

Persistence Store: MedRec-fs

JMS Server: MedRecJMSServer

JMS Module: MedRecModule

MedRecModule:

Subdeployment: MedRecJMS

Connection Factory:

Name: MedRecConnectionFactory

JNDI Name: com.oracle.medrec.jms.connectionFactory

Distributed Queue:

Name: PatientNotificationQueue

JNDI Name: com.oracle.medrec.jms.PatientNotificationQueue

Applications: medrec.ear

physician.ear

chat.war

- a. Open a new tab.
- b. cd /u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab2/
- c. **./Medrec1DB.sh** (It creates the required database user and populate sample data into database)
- d. Close the tab.
- e. In Enterprise Manager, Click on **WebLogic Domain > Environment -> Virtual Targets**.

The screenshot shows the Oracle Enterprise Manager interface. The left sidebar has a tree view with 'Cluster' selected. The main menu under 'WebLogic Domain' has 'Environment' highlighted with a red box. Under 'Environment', 'Virtual Targets' is also highlighted with a red box. A tooltip above the 'Virtual Targets' link says 'the selected Server(s):app-cluster-2, app-cluster-1'. On the right, there's a table for 'Virtual Targets' with columns: Cluster Messaging Mode, Default Load Algorithm, and Replication Type. One row is shown with values: Unicast, Round Robin, and (None). Below the table, it says 'Clusters 1 of 1'.

- f. Click on **Create**.
- g. Enter **VT-Medrec-1** as Name and **/dp1** as Uri Prefix and Add **localhost** as Hosts then click on **Next**.

The screenshot shows the 'Create Virtual Target: General' wizard. Step 1 of 2 is selected. The 'Name' field contains 'VT-Medrec-1' and the 'Uri Prefix' field contains '/dp1'. Under 'Hosts', there's a table with a single entry 'localhost'. At the bottom, there are 'Back', 'Step 1 of 2', 'Next', and 'Cancel' buttons. The 'Next' button is highlighted with a red box.

h. Select Cluster **app-cluster** as Target then click on **Create**.

The screenshot shows the Oracle Enterprise Manager interface for creating a virtual target. The top navigation bar says "ORACLE Enterprise Manager Fusion Middleware Control 12c". Below it, a breadcrumb path shows "base_domain". A tabs section has "General" and "Targets" tabs, with "Targets" being the active one. The main content area is titled "Create Virtual Target: Targets". It contains a sub-header "Choose a server or cluster to be associated with this virtual target." and a dropdown menu where "Cluster" is selected from "app-cluster". There are also "Server" and "None" options. At the bottom right of the content area are buttons for "Back", "Step 2 of 2", "Next", "Create" (which is highlighted with a red box), and "Cancel".

i. Click on **WebLogic Domain -> Environment -> Domain Partitions**.

The screenshot shows the Oracle Enterprise Manager navigation tree. The root node is "base_domain". Under "WebLogic Domain", the "Environment" node is selected and highlighted with a red box. Under "Environment", the "Domain Partitions" node is also selected and highlighted with a red box. To the right of the navigation tree is a table titled "Domain Partitions". The table has columns: "Used By", "Servers", "Server Templates", "Clusters", "Machines", and "Log File Name". One row in the table is visible, showing "logs/virtualTarget..". At the bottom of the table, it says "Virtual Targets 1 of 1". The top right corner of the screen shows the date and time: "Nov 5, 2015 2:34:08 AM PST".

Used By	Servers	Server Templates	Clusters	Machines	Log File Name
					logs/virtualTarget..

- j. Click on “**Enable Lifecycle Manager**”.
- k. Go back to base_admin terminal, press CTRL+C, to stop the admin server.
- l. ./startWebLogic.sh
- m. Go back to Firefox, and type the Fusion Middleware Control Console URL <http://localhost:7001/em>.
- n. Enter **weblogic/welcome1** as **User Name/Password** then Click on **Login**.
- o. Click on **WebLogic Domain -> Environment -> Domain Partition**.
- p. Click on **Create**.
- q. Enter **dp1** as Name then click on Next.

ORACLE® Enterprise Manager Fusion Middleware Control 12c weblogic ▾ ...

General Available Targets Resource Group Summary

Create Domain Partition: General

Back Step 1 of 4 **Next** Cancel

Use this page to specify general attributes for this domain partition.

* Name	dp1
Security Realm	None
Primary Identity Domain	

Load Balancer Configuration

If you wish to use a load balancer to front-end this domain partition, choose an Oracle Traffic Director runtime from the list of registered runtimes shown below. If you wish to register a new OTD runtime, please use the Environment->OTD Runtimes menu item on the WebLogic Domain menu.

Use OTD for load balancing	<input type="checkbox"/>
OTD Runtime	None

- r. Check the left box near **VT-Medrec-1** and also check the box for **Set as Default** then click on **Next**.

ORACLE® Enterprise Manager Fusion Middleware Control 12c weblogic ▾ ...

base_domain [i](#)

General Available Targets Resource Group Summary

Create Domain Partition: Available Targets

Back Step 2 of 4 **Next** Cancel

Select the virtual targets that will be available for this domain partition to use. Note that virtual targets can only be used by one partition; so, only available virtual targets are listed below.

Select	Virtual Target	Set as Default
<input checked="" type="checkbox"/>	VT-Medrec-1	<input checked="" type="checkbox"/>

- s. Enter **app1RG** as Resource Group name and **None** as Resource Group Template, Move the **VT-Medrec-1** virtual target to **Selected targets** then click on **Next**.

Create Domain Partition: Resource Group

A resource group needs to be created within a partition before you can deploy applications or resources. The resource group can optionally extend a resource group template specified at the domain level.

* Resource Group Name **app1RG**

Resource Group Template **None**

Targets for the Resource Group Select a target for the resource group from the list of available targets. If the partition has a default target specified, the resource group will implicitly inherit that target.

Available Targets	Selected Targets
VT-Medrec-1	VT-Medrec-1

- t. Verify the configuration and click on **Create**.
u. Check the box near **dp1** and click on **Control -> Start**. Once you notice the message “**Partition state after the operation is RUNNING**” then Click on Close.

Domain Partitions

Domain partitions are the building blocks of WebLogic server multi-tenancy (MT). Multi-tenancy permits multiple client organizations to share a domain, improving efficiency and reducing operation costs. Before creating a domain partition, you must first create one or more virtual targets. Look at the Getting Started topics for more information.

► Getting Started with Multi-Tenancy

Hide Pie Chart

Name	Status	OTD Partition	Realm	Default Targets	Available Targets
dp1	Down			VT-Medrec-1	VT-Medrec-1

Domain Partitions 1 of 1

v. Click on the Domain Partition **dp1**.

Name	Status	State	OTD Partition	Realm	Default Targets	Available Targets
dp1		Running			VT-Medrec-1	VT-Medrec-1

w. Click on **Domain Partition -> Administration -> Resource Group**.

The screenshot shows the Oracle Enterprise Manager interface for Fusion Middleware Control 12c. The top navigation bar includes "WebLogic Domain" and "weblogic". The main content area is for the domain partition "dp1". On the left, there is a navigation tree with sections like Monitoring, Diagnostics, Control, Logs, Deployments, JDBC Data Sources, Messaging, Coherence Caches, Web Services, Other Services, Administration, Security, System MBean Browser, and Target Sitemap. The "Administration" section is highlighted with a red box. Under "Administration", the "Resource Groups" option is also highlighted with a red box. The right side of the screen displays monitoring metrics for "General" and "JDBC and JTA Usage", and a "Resource Usage" section.

- x. Click on Resource Group **app1RG**.
- y. Creation of Datasource.
 - i. Select the **Services** tab.
 - ii. Choose JDBC tab, click on **Create > Generic Data Source**.

The screenshot shows the Oracle Enterprise Manager interface for a WebLogic Domain named 'weblogic'. The top navigation bar includes 'WebLogic Domain' and 'weblogic'. Below the navigation is a toolbar with 'Domain Partition' (dp1), 'Start Up', 'Shut Down', 'Auto Refresh' (Off), and a date/time stamp 'Nov 5, 2015 2:44:29 AM PST'. The main content area is titled 'Resource Group : app1RG'. The 'Services' tab is selected, indicated by a red box. Under the 'JDBC' tab, a dropdown menu shows 'Generic Data Source' highlighted with a red box. Other options in the dropdown include 'GridLink Data Source' and 'Multi Data Source'. The main table displays columns for 'Name', 'JNDI Name', 'Type', and 'Targets'. The status bar at the bottom right shows 'JDBC Data Sources 0 of 0'.

- iii. Enter **MedRecGlobalDataSourceXA** as Data Source Name and **jdbc/MedRecGlobalDataSourceXA** as JNDI Name, and then click on Select.

The screenshot shows the 'Create a JDBC Data Source: Data Source Properties' step of a wizard. The top navigation bar shows 'weblogic'. Below it is a progress bar with five steps: 'Data Source Properties' (selected), 'Connection Properties', 'Transaction Properties', 'Select Targets', and 'Review'. The main form is titled 'Create a JDBC Data Source: Data Source Properties'. It includes fields for 'Data Source Name' (MedRecGlobalDataSourceXA), 'Scope' (Resource group "app1RG" in domain partition "dp1"), 'Type' (Generic), 'Database Type' (Oracle), 'Driver Class Name' (oracle.jdbc.OracleDriver), and 'JNDI Name' (jdbc/MedRecGlobalDataSourceXA). A 'Select...' button next to the Driver Class Name field is highlighted with a red box. At the bottom right are 'Back', 'Step 1 of 5', 'Next', and 'Cancel' buttons.

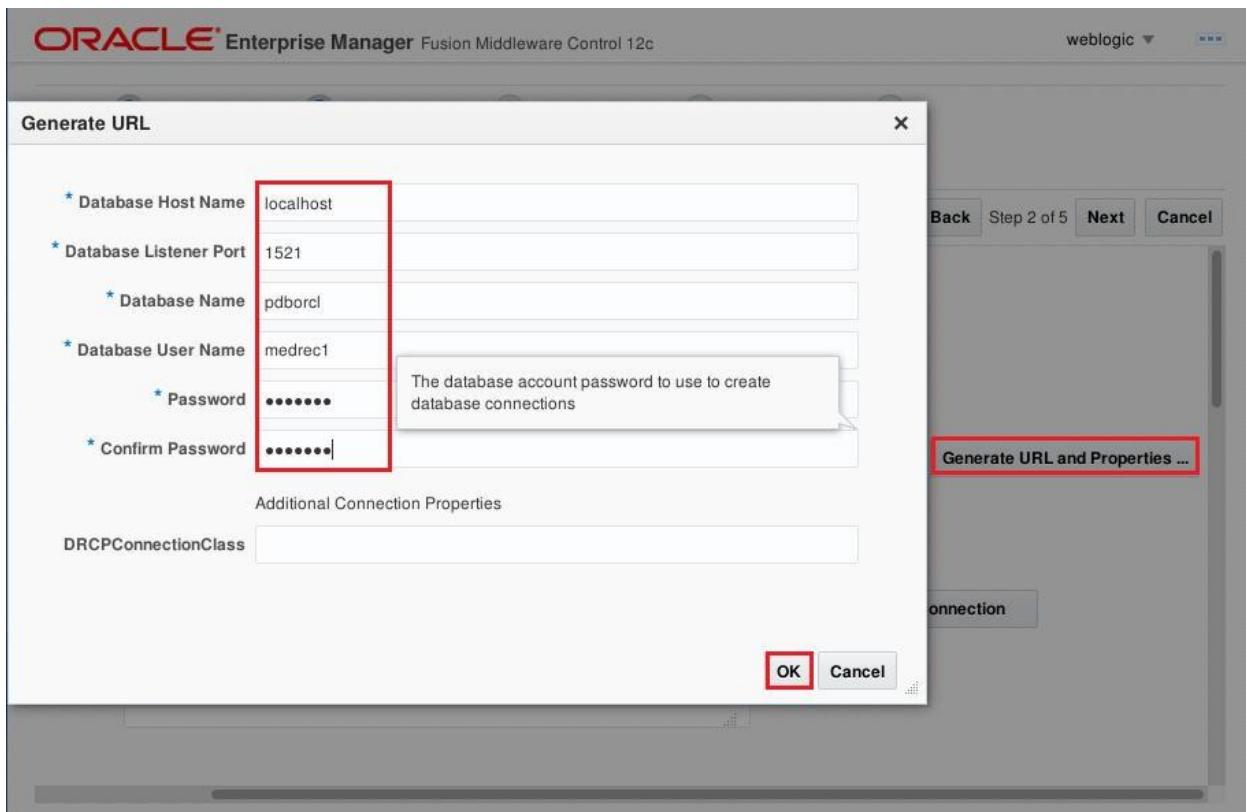

- iv. Select **Oracle** as Database Type and “**Oracle’s Driver (Thin XA) for service connections; Versions: Any**” as JDBC Driver then click on OK.

- v. Click on **Next**.
vi. Click on **Generate URL and Properties** and Enter the following:

Host Name:	localhost
Listen Port:	1521
Database Name:	pdborcl
User Name:	medrec1
Password:	medrec1
Confirm Password	medrec1

Click OK.

vii. Click on **Test Database Connection** to verify the connection. Click **Next**.

The screenshot shows the Oracle Enterprise Manager Fusion Middleware Control 12c interface. A modal dialog titled "Confirmation" is displayed, stating "Connection test succeeded." with an "OK" button. The main page is titled "Create a JDBC Data Source: Connection" and contains "Database Connection Information". The "Driver Class" is set to "oracle.jdbc.xa.client.OracleXADataSource". The "Database URL" is "jdbc:oracle:thin:@//localhost:1521/pdborcl". The "Password" and "Confirm Password" fields both contain "*****". The "SQL ISVALID" field shows "Test Database Connection" (which is also highlighted with a red box). Below the form, there is a "Properties" section and a URL "localhost:7001/em/faces/as-emas_createDS_taskflow/as/jdbc/createDSStep2#".

viii. Leave Default on **Transaction Options** and click on **Next**.

ix. Verify the configuration and click on **Create**.

z. Adding User to Default Realm.

i. Click on **Weblogic Domain -> Security -> Users and Groups**.

The screenshot shows the Oracle Enterprise Manager Fusion Middleware Control 12c interface. On the left, under "base_domain", it says "WebLogic Domain". In the center, a "Confirmation" message states "JDBC Data Source 'MedRecGlobalDataSourceXA' has been created successfully. All changes have been saved." Below this, the "Resource Group : app1RG" page is shown. The "Services" tab is selected, and the "JDBC" sub-tab is active. A table lists a single entry: "Name" is "MedRecGlobalDataSourceXA" and "JNDI Name" is "jdbc/MedRecGlobalDataSourceXA". The "Security Realms" column shows a dropdown menu with "Users and Groups" and "Keystore", where "Users and Groups" is highlighted with a red box. On the right, a sidebar menu is open, showing various options like Home, Monitoring, Diagnostics, Control, Logs, Environment, Deployments, JDBC Data Sources, Messaging, Cross Component Wiring, Web Services, Other Services, Administration, Refresh WebLogic Domain, and System MBean Browser. The "Security" option is highlighted with a red box. At the bottom right of the sidebar, there is a link to "Target Sitemap".

- ii. In **Users** tab, click on **Create**.

Users and Groups

This page displays information about the users and groups that have been configured in the selected security realm in this WebLogic Server domain.

Select a Realm: myrealm

Default Realm for This WebLogic Domain: true

JNDI Name: mail/MedRecMailSession

The screenshot shows the 'Create a Mail Session: General Configuration' page. The 'Name' field contains 'MedRecMailSession'. The 'Scope' dropdown shows 'Domain Partition Resource Group' with 'app1RG in partition dp1' selected. The 'JNDI Name' field contains 'mail/MedRecMailSession'. The 'Next' button is highlighted with a red box.

vi. Click on **Create**.

bb. Configuring JMS Server.

i. Click on **Domain Partition** -> **Messaging** -> **JMS Servers**.

The screenshot shows the 'Domain Partition' section of the Oracle Enterprise Manager. The 'Messaging' option under 'Domain Partition' is selected and highlighted with a red box. A tooltip message 'as been created successfully. All changes have been activated.' is visible above the 'JMS Servers' link. The 'JMS Servers' link is also highlighted with a red box.

- ii. Click on **Create**. Enter **MedRecJMSServer** as Name then click on **Create a Store** -> **File Store**.

JMS servers act as management containers for the queues and topics in JMS modules that are targeted to them. A JMS server's primary responsibility for its destinations is to maintain information on what persistent store is used for any persistent messages that arrive on the destinations, and to maintain the states of durable subscribers created on the destinations.

Use this page to define the general configuration parameters for this JMS server.

* Name

Scope Domain Partition Resource Group

Persistent Store

- iii. Enter **MedRec-fs** as Name then click on **Next**. Click on **Create**.
 iv. In **JMS Server: General Setting**, Select the newly created file store as persistent store then click on **Next**.

Information
Persistent store "MedRec-fs" has been created successfully. All changes have been activated.

JMS servers act as management containers for the queues and topics in JMS modules that are targeted to them. A JMS server's primary responsibility for its destinations is to maintain information on what persistent store is used for any persistent messages that arrive on the destinations, and to maintain the states of durable subscribers created on the destinations.

Use this page to define the general configuration parameters for this JMS server.

* Name

Scope Domain Partition Resource Group

Persistent Store

- v. Click on **Create**.
- cc. Configure JMS Module.
- Click on **Domain Partition -> Messaging -> JMS Resources and Modules**.

The screenshot shows the Oracle Enterprise Manager interface for a WebLogic Domain named 'weblogic'. The left sidebar shows a tree structure with 'dp1' selected. Under 'dp1', the 'Domain Partition' menu is open, and 'Messaging' is highlighted with a red box. A sub-menu for 'Messaging' is displayed, with 'JMS Resources and Modules' also highlighted with a red box. To the right, a table titled 'JMS Resources and Modules' shows one entry: 'app1RG'. At the bottom of the table, it says 'JMS Servers 1 of 1'. A yellow box highlights a message box containing the text: 'JMS module has been created successfully. All changes have been activated.'

- Under the **JMS Modules** tab, click on **Create**.

The screenshot shows the same Oracle Enterprise Manager interface as the previous one, but now the 'JMS Modules' tab is selected in the top navigation bar. A red box highlights the 'Create' button. Below the navigation bar, a message says 'To configure and manage JMS modules, use the [WebLogic Server Administration Console](#)'. The main content area displays a table for 'JMS Resources' with columns: Name, Resource Group, Queues, Topics, Connection Factories, Distributed Queues, Distributed Topics, Foreign Servers, Quotas, and Hand. A note at the bottom says 'The table is empty'. At the bottom of the page, it says 'JMS Modules 0 of 0'.

- iii. Enter **MedRecModule** as Name then click on **Next**. Click on **Create**.
- iv. Under **JMS Modules** tab, click on **MedRecModule**.

JMS Resources and Modules

To configure and manage JMS modules, use the [WebLogic Server Administration Console](#).

Name	Resource Group	Queues	Topics	Connection Factories	Distributed Queues	Distributed Topics	Foreign Servers	Quotas	Handle
MedRecModule	app1RG	0	0	0	0	0	0	0	

- v. Under **Subdeployment** tab, click on **Create**.

JMS Module: MedRecModule

To configure and manage this JMS module, use the [WebLogic Server Administration Console](#).

Name	Resources	Targets
The table is empty		

- vi. Enter **MedRecJMS** as Name and Select the box near **MedRecJMSServer** then click on **Create**.

Create a Subdeployment

Subdeployment Name **MedRecJMS**

Select targets for this subdeployment.

JMS Servers

Select Name
MedRecJMSServer

SAF Agents

Select Name

Create **Cancel**

- vii. Under **General** tab, click on **Create**.

JMS Module: MedRecModule

To configure and manage this JMS module, use the [WebLogic Server Administration Console](#).

General Subdeployments Notes

This page displays general information about a JMS system module and its resources. It also allows you to configure new resources and access existing resources.

Name: MedRecModule
Scope: Resource group "app1RG" in domain partition "dp1"
Descriptor File Name: partitions/dp1/jms/medrecmodule-jms.xml

This page summarizes the JMS resources that have been created for this JMS system module, including queue and topic destinations, connection factories, JMS templates, destination sort keys, destination quota, distributed destinations, foreign servers, and store-and-forward parameters.

Create **Delete** **Detach**

- viii. Select box near **Connection Factory** then click on **Next**.

Create a JMS System Module Resource: Resource Type

Choose the type of JMS resource that you would like to create.

- ▲ Connection Factory
 - Connection Factory
- ▲ Destination
 - Destination Key
 - Quota

Connection Factory

A connection factory defines configuration parameters that are used to create connections for WebLogic JMS clients. A client's connection factory must be hosted on the same server or cluster as the client's destinations.

Back Step 1 of 5 **Next** Cancel

- ix. Leave Default in **JMS System Module** Page then click on **Next**.
 x. Enter **MedRecConnectionFactory** as Name and
com.oracle.medrec.jms.connectionFactory as JNDI Name then click on **Next**. Click on **Create**.

Create a Connection Factory: Properties

Specify the properties that you would like to identify your new JMS resource.

Resource Type	Connection Factory
* Name	<input type="text" value="MedRecConnectionFactory"/>
JNDI Name	<input type="text" value="com.oracle.medrec.jms.connectionFactory"/>
Notes	

<p>The global JNDI name used to look up a connection factory within a clustered JNDI namespace.</p>

Back Step 3 of 5 **Next** Cancel

- xi. Under General tab, Click on **Create**.
- xii. Select **Uniform Distributed Queue** then click on **Next**.

Create a JMS System Module Resource: Resource Type

Choose the type of JMS resource that you would like to create.

Resource Type

- Connection Factory
 - Connection Factory
- Destination
 - Destination Key
 - Quota
 - JMS Template
- Queue
 - JMS Queue
 - Uniform Distributed Queue
- Topic
 - JMS Topic
 - Uniform Distributed Topic

Uniform Distributed Queue

A uniform distributed topic is a logical topic that references a set of automatically generated JMS topic instances, each hosted on a different JMS server.

Note: depending on the type of resource selected, you will be prompted to enter basic information for the new JMS resource to be created in next step. For targetable resources, like stand-alone queues and topics, connection factories, distributed queues and topics, foreign servers, and SAF import destinations, you can also proceed to "Targets" step for selecting the appropriate targeting policy. For untargetable resources, like destination keys, quotas, templates, SAF error handling, and remote SAF context, the "Targets" step will be skipped.

xiii. Click on **Next**.

xiv. Enter the following and click on **Next**.

Name: PatientNotificationQueue

JNDI Name: com.oracle.medrec.jms.PatientNotificationQueue

Create a Uniform Distributed Queue: Properties

Specify the properties that you would like to identify your new JMS resource.

Properties

Resource Type	Uniform Distributed Queue
* Name	PatientNotificationQueue
Notes	<p>The name used to bind a virtual destination to the JNDI tree. Applications can use the JNDI name to look up the virtual destination.</p>
JNDI Name	com.oracle.medrec.jms.PatientNotificationQueue
Template	(None)

- xv. Click on **Create**. Click on **PatientNotificationQueue**, Under **Targeting**, Select **Subdeployment targeting as Targeting Policy** and **MedRecJMS** as **Subdeployment** then click on **Apply**.

The screenshot shows the Oracle Enterprise Manager interface for configuring a JMS resource. The top navigation bar includes Configuration, Monitoring, Notes, General, Advanced Configuration, Delivery Failure, Delivery Overrides, Logging, and Thresholds and Quotas. The General tab is selected. In the main content area, there is a 'Reset Delivery Count On Forward' checkbox. Below it, the 'Targeting' section is expanded, showing two radio buttons: 'Subdeployment targeting' (selected) and 'Default to the parent module's target'. Under 'Subdeployment', a dropdown menu is open, with 'MedRecJMS' selected.

Note: You must restart domain partition before going to deploy Medrec Application.

- Click on Change Center -> View Restart Checklist.

The screenshot shows the Oracle Enterprise Manager interface with a context menu open over a domain partition named 'dp1'. The menu items include Edit Sessions, Lock & Edit, View Change List, View & Resolve Conflicts, Release Configuration, Activate Changes, Undo All Changes, and a redboxed 'View Restart Checklist'. Other menu items like Console and Help are also visible. The main pane shows a confirmation message: 'Settings updated successfully. All changes have been activated. There are 1 or more item(s) that must be effect. Use the "View Restart Checklist" menu in Change Center to view the details.' Below this, the 'Uniform Distributed Queue: PatientNotificationQueue' configuration page is shown, with the General tab selected. The configuration details include Name: PatientNotificationQueue and Scope: Resource group "app1RG" in domain partition "dp1".

b. Select the box near to dp1 then click on Restart.

Restart Checklist			
This page lists servers, domain partitions, system components, and other resources that must be restarted for configuration changes to take effect. To restart, select the resource you would like to restart and click Restart button.			
Name	Resource Type	Targets	Status of Last Action
dp1	Domain Partition		START (TASK COMPLETED)

c. On Confirmation Screen, Click on Restart.

dd. Deployment of Medrec Application.

i. Click on **WebLogic Domain -> Environment -> Resource Groups**.

The screenshot shows the Oracle Enterprise Manager Fusion Middleware Control 12c interface. The left pane displays the configuration for a Uniform Distributed Queue named 'PatientNotificationQueue'. The right pane shows the navigation menu under 'Environment'.

Left Panel (Configuration):

- General tab selected.
- Name: PatientNotificationQueue
- Scope: Resource group
- JNDI Name: com.oracle.
- Template: None

Right Panel (Navigation Menu):

- Home
- Monitoring
- Diagnostics
- Control
- Logs
- Environment** (selected)
- Deployments
- JDBC Data Sources
- Messaging
- Cross Component Wiring
- Web Services
- Other Services
- Administration
- Refresh WebLogic Domain
- Security
- System MBean Browser
- WebLogic Server Administration Console
- Target Sitemap

- ii. Click on Resource Group **app1RG**, click on **Deployments** tab.
- iii. Click on **Deployment -> Deploy**.

The screenshot shows the Oracle Enterprise Manager interface for a WebLogic Domain. The top navigation bar includes 'WebLogic Domain' and 'weblogic'. The URL is /Domain_base_domain/base_domain > Resource Groups > Resource Group : app1RG. The main content area is titled 'Resource Group : app1RG' and has tabs for General, Deployments, Services, Targets, Monitoring, Control, and Notes. The 'Deployments' tab is selected and highlighted with a red box. Below it, there's a message: 'This page displays a list of Java EE applications and standalone application modules that have been deployed to this resource group.' Underneath are filter options: 'View' (dropdown), 'Show All' (checkbox), 'Deployment' (dropdown), 'Override' (dropdown), and 'Control' (dropdown). A table header row shows columns for Name, Status, State, Health, and Type. A message below the table says 'No deployments found. Select a deployment target to view existing applications, resource adapters, and libraries.' A context menu is open over the 'Deployment' dropdown, with the 'Deploy' option highlighted and also enclosed in a red box. Other options in the menu include 'Redeploy', 'Undeploy', and 'Fetch Deployment Plan'. At the bottom right of the table area, it says 'Deployments 0 of 0'.

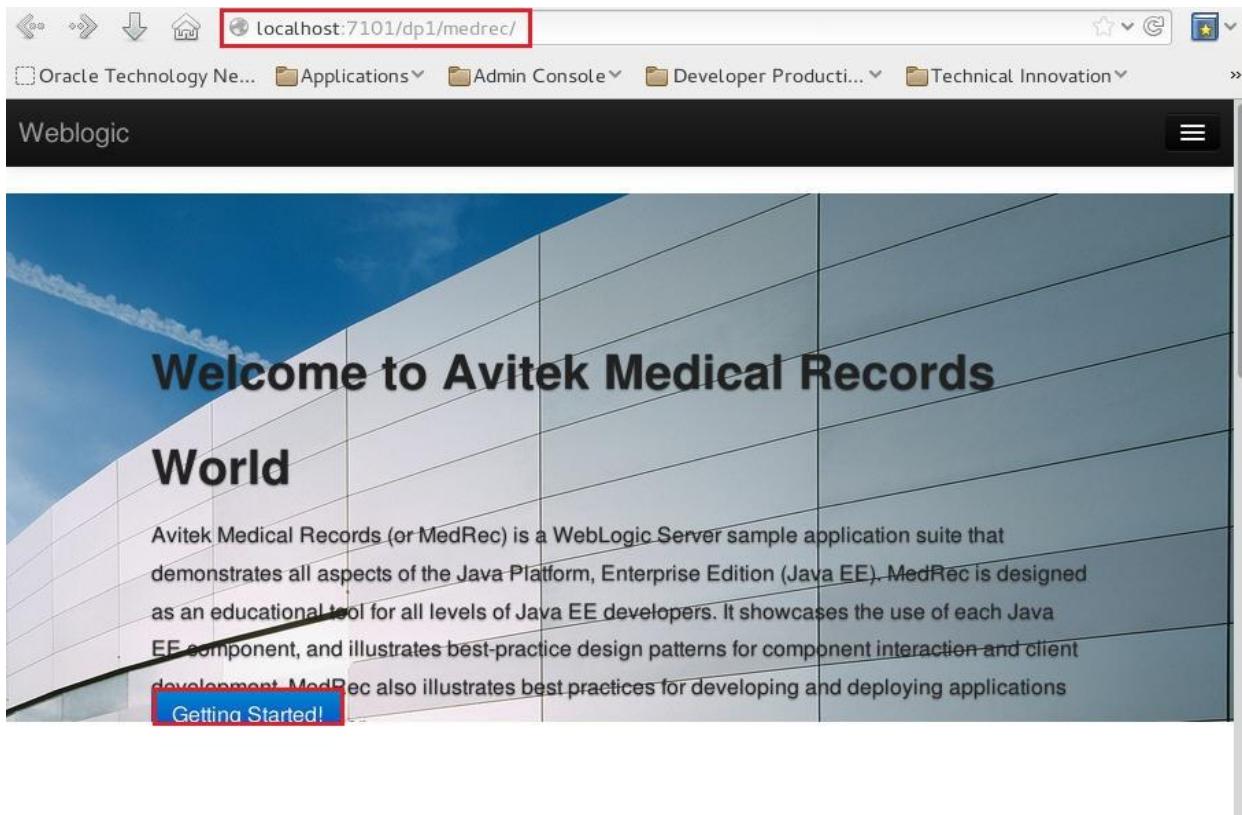

- iv. Select “Archive or exploded directory is on the server where Enterprise Manager is running” then click on **Browse**. Specify the location of **medrec.ear** from **/u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab2** then click on **OK**.

The screenshot shows the 'Deploy Java EE Application: Select Archive' wizard, Step 1 of 4. The top navigation bar includes 'base_domain'. Below it are tabs: 'Select Archive' (highlighted with a blue circle), 'Select Target', 'Application Attributes', and 'Deployment Settings'. The main content area is titled 'Deploy Java EE Application: Select Archive'. It has a 'Scope' section stating 'The scope that this application will be deployed to : Resource group "app1RG" in domain partition "dp1"'. A 'Archive or Exploded Directory' section follows, with a note: 'Java EE archives, Web Modules (WAR files), EJB Modules (EJB JAR files), Resource Adapter Modules (RAR files), Coherence Archives (GAR files), JDBC Modules, JMS Modules, and library files (Jar files) can be deployed. You can also deploy an exploded archive that is present on the server where Enterprise Manager is running.' There are two radio button options: 'Archive is on the machine where this Web browser is running.' (unchecked) and 'Archive or exploded directory is on the server where Enterprise Manager is running.' (checked). Below this is an input field containing the path '/u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab2/medrec.ear'. To the right of the input field is a 'Browse...' button, which is also highlighted with a red box. On the far right, there is a vertical sidebar with some text and icons.

- v. Click on **Next** then click on **Deploy**. Click on Close.
- vi. Deploy **physician.ear** file similarly from the **/u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab2** location.
- vii. Deploy **chat.war** file similarly from the **/u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab2** location.

Accessing Medrec Application in Domain Partition dp1

- i. Go to Firefox and type the URL: <http://localhost:7101/dp1/medrec/>
- ii. Click on Getting Started.

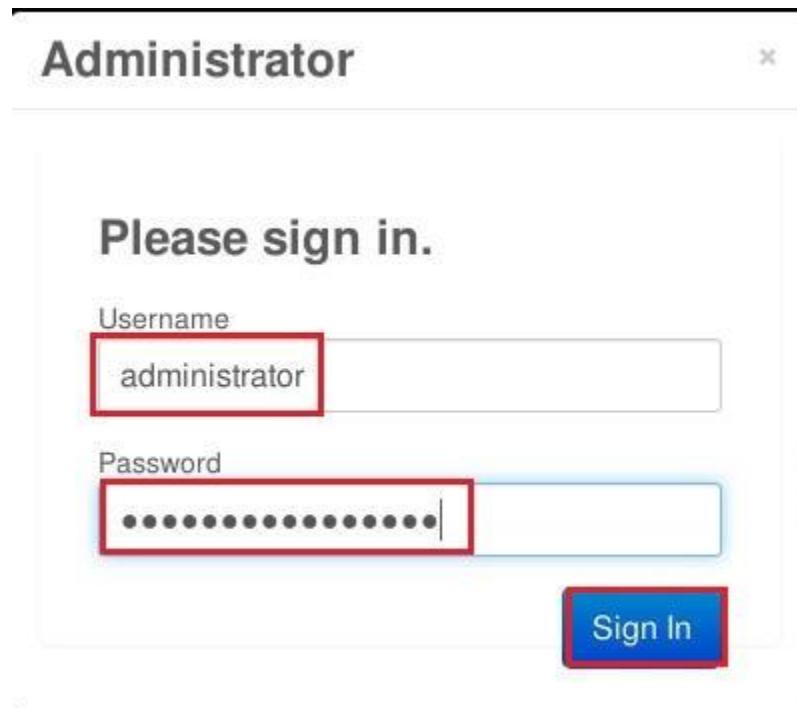

- iii. Under Patient, Click on **I'm New Here**
- iv. Enter the following or any other data then click on Submit.

Email:	weblogic@oracle.com
Password:	welcome1
Confirm Password:	welcome1
First Name:	Ankit
Last Name:	Pandey
Gender:	Male
DOB:	Jun 23, 1988
SSN:	123456788

Note: Make sure you not use 123456789 as SSN Number.

- v. Click on **Getting Started** again on Medrec Home Page.
- vi. Under Administrator, Click on **Login**.

- vii. Enter **administrator/administrator123** as username and password then click on **Sign In**.

The screenshot shows a login interface titled "Administrator". The main message is "Please sign in.". There are two input fields: "Username" containing "administrator" and "Password" containing a series of dots ("••••••••••••"). A blue "Sign In" button is at the bottom right.

- viii. Under **Pending Requests**, click on **Go**.
ix. Click on the Email Id, and then click on **Approve**.
x. Click on Logout. Click on Logout again.
xi. You can login as weblogic@oracle.com/welcome1 as username/password as Patient.
xii. You can view your record summary, and you can also have interaction with physician.

Patient look up and view your visit and prescription history and edit your profile information.

The Patient application allows patients to log in, edit their profile information, or request that their profile be added to the system. Patients can also view prior medical records of visits with their physician.

Login

I'm New Here

Configuration of Medrec Application in Domain Partition 2

In the next step we are creating the below configuration for Medrec application in domain partition dp2. We are using the same Medrec applications and same JNDI name for the Datasources, connection factory and Distributed queue but we will connect to different database. So there are two benefits of Multitenancy.

- In a domain, you can deploy the same application in two different domain partitions and there will be no JNDI conflict. You do not have to make any changes in application.
- In single domain, you can have same application deployed in two different domain partitions and connected to two databases. So both the application will have different Set of Users in our case or different set of Application Specific Data.

Virtual Target: VT-Medrec-2

Domain Partition: dp2

Resource Group app2RG

app1RG:

Datasource:	MedRec2GlobalDataSourceXA, jdbc/MedRecGlobalDataSourceXA
Mail Session:	MedRecMailSession, mail/MedRecMailSession
Persistence Store:	MedRec2-fs
JMS Server:	MedRec2JMSServer
JMS Module:	MedRec2Module
MedRecModule:	
Subdeployment:	MedRec2JMS
Connection Factory:	MedRec2ConnectionFactory, com.oracle.medrec.jms.connectionFactory
Distributed Queue:	PatientNotificationQueue com.oracle.medrec.jms.PatientNotificationQueue
Applications:	medrec.ear physician.ear chat.war

The Scripts MedrecInDP2.sh creates the Virtual Target, Domain Partition, Resource Group, JDBC Datasource, JMS Server, JMS Module, Distributed Queue and Connection Factory then deploys the medrec.ear, physician.ear and chat.war.

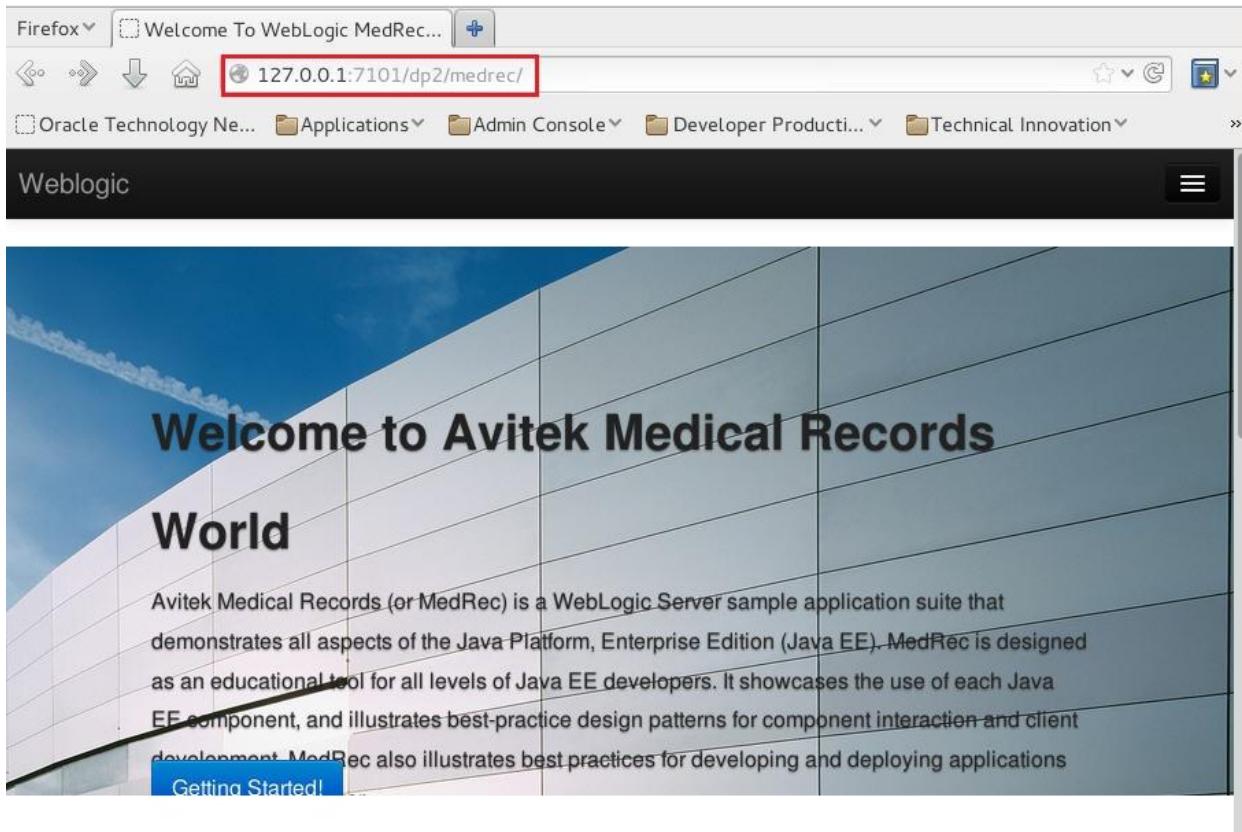

- a. Open a new tab.
- b. cd /u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab2
- c. ./Medrec2DB.sh (It creates the required user medrec2 in pdb2 and populates the sample data.)
- d. ./MedrecInDP2.sh
- e. Go back to Fusion Middleware Control <http://localhost:7001/em>.
- f. Verify the creation of the following resources.
 - i. Click on **WebLogic Domain ->Environment ->Virtual Target**. Here we have **dp2** as **URI Prefix** for the Virtual Target **VT-Medrec-2**.
 - ii. Click on **WebLogic Domain ->Environment ->Domain Partition**.
 - iii. Click on Domain Partition **dp2** then Select **Domain Partition -> Administration -> Resource Groups**.
 - iv. Click on Resource group **app2RG**.

- v. In the “Services” and “Deployments” tab, you can verify the creation of above System Resources here.

Accessing Medrec Application in Domain Partition dp2

While accessing the application we need to use the Virtual Target URI. As domain partition dp2 is targeted to Virtual Target VT-Medrec-2, which has /dp2 as URI, we need to add it in URL for the accessing the application.

- a. In Firefox, type the URL: <http://localhost:7101/dp2/medrec/>

- b. As both this application has exactly same JNDI name used within application, JNDI name of Datasource, JMS connection factory, mail sessions, Distributed Queue.
c. Click on Getting Started!
d. Under **Patient**, Click on Login, Try to login with weblogic@oracle.com/welcome1. You will not be able to login. As both Medrec application is connected to different database. So in Multitenant WebLogic Server, you can deploy exactly same application with same configuration but with different database and there will be no JNDI conflict in domain.

Configuration of Day Trader application in domain partition 3

Here we will create the below configuration through WLST to Run Day Trader Application on Domain Partition dp3.

Virtual Target: VT-daytrader

Domain Partition: dp3

Resource Group app3RG

app1RG:

Datasource:

Name:	jdbc/datasources/TradeDataSource,
JNDI Name:	jdbc/datasources/TradeDataSource
Name:	jdbc/datasources/NoTxTradeDataSource
JNDI Name:	jdbc/datasources/NoTxTradeDataSource

Persistence Store: MyFileStore

JMS Server: MyJMServer

JMS Module: MyJMSModule

MyJMSModule:

Subdeployment: MySubdeployment

Connection Factory:

Name:	jms/myQueueConnectionFactory,
JNDI Name:	jms/myQueueConnectionFactory
Name:	jms/myTopicConnectionFactory
JNDI Name:	jms/myTopicConnectionFactory

Distributed Queue:

Name:	jms/TradeBrokerQueue
JNDI Name:	jms/TradeBrokerQueue

Distributed Topic:

Name:	jms/TradeStreamerTopic
JNDI Name:	jms/TradeStreamerTopic

Applications: web-3.0.0.war

This DayTraderInDP3.sh creates the Virtual Target, Domain Partition, Resource Group, JDBC Datasource, JMS Server, JMS Module, Distributed Queue and Connection Factory then deploys the web-3.0.0.war.

- a. cd/ u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab2
- b. ./DayTrader3DB.sh (It creates the required user for pdborcl database.)
- c. ./DayTraderInDP3.sh
- d. Go back to Fusion Middleware Control <http://localhost:7001/em>
- e. Verify the creation of the following resources.
 - i. Click on **WebLogic Domain ->Environment ->Virtual Target**. Here we have **dp3** as **URI Prefix** for the Virtual Target **VT-daytrader**.
 - ii. Click on **WebLogic Domain ->Environment ->Domain Partition**.
 - iii. Click on Domain Partition to **dp3** then Select **Domain Partition -> Administration -> Resource Groups**.
 - iv. Click on Resource group **app3RG**.
 - v. In **Services** and **Deployments** tab, you can verify the creation of above System Resources here.

Access Day Trader Application in Domain Partition dp3

- a. Go to Firefox and type the URL: <http://localhost:7101/dp3/daytrader/>
- b. We will not test here the application behavior. The application is loaded and is running inside partition.

You can create many domain partitions in WebLogic 12.2.1. Your application does not require any specific application development. Your application which is working in previous version of WebLogic 12c, you can deploy them in multitenant environment without modifying the application. Daytrader application is developed by IBM which we deployed in domain partition dp3. So you can also easily deployed application build on different platform to WebLogic Server.

LAB 3: SECURITY ISOLATION

Overview

A security realm comprises mechanism for protecting WebLogic resources. Each security realm consists of a set of configured security providers, users, groups, security roles, and security policies. You use realms to configure authentication, authorization, role mapping, credential mapping, auditing and other services.

WebLogic Server traditionally supports multiple realms in a domain configuration, but only one realm—typically referred to as the “default realm” or “admin realm”—can be active at any given time.

In contrast, WebLogic Server MT supports multiple active realms and allows each partition to execute against a different realm.

This means that a partition can have unique security providers, users, groups, security roles and security policies. Resources and applications in the domain partition are available to only to users within the domain partition’s security realm. Other tenants cannot see or access the resources or applications.

Note: Partition can share a security realm, with consequent loss of independence isolation. In particular if you do not specify a realm when you create a partition, the default realm is shared with the partition and there is no security isolation between the partition and the domain.

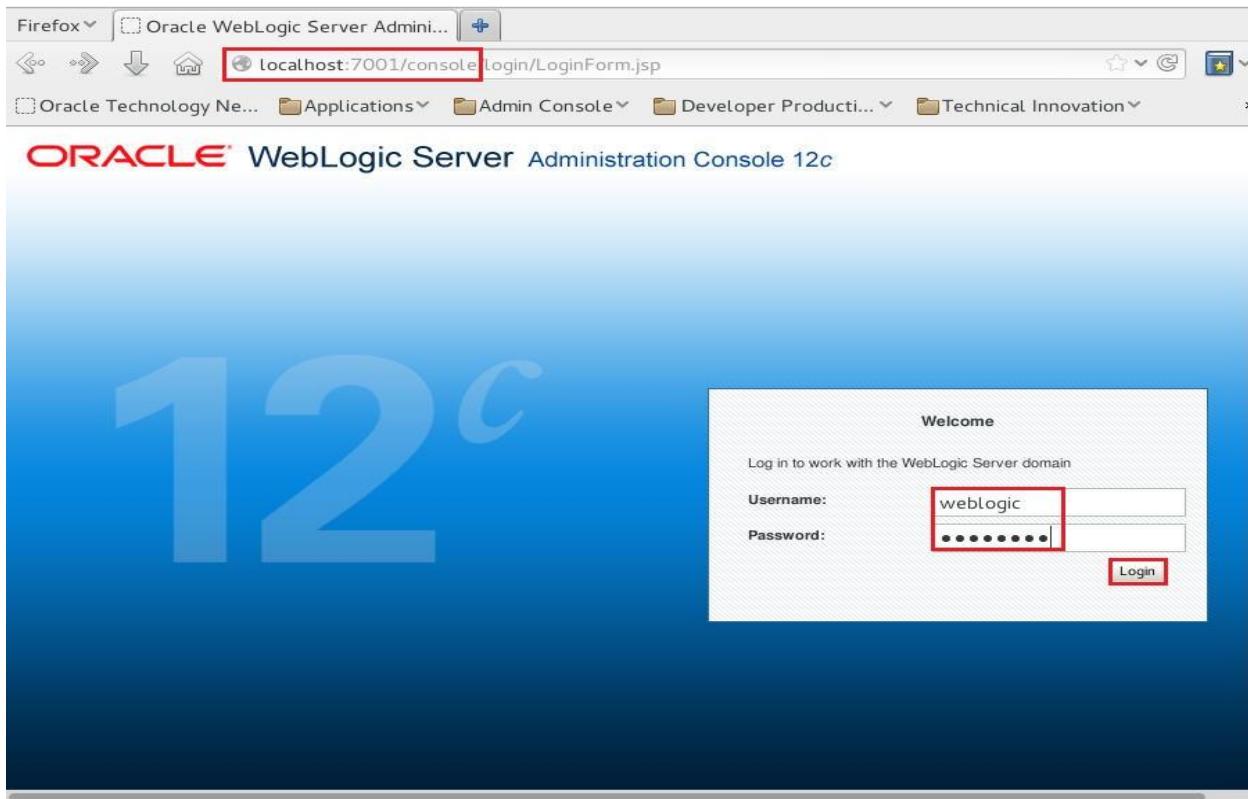

In this Lab, first we will create a new security realm then we will assign the security realms to a partition dp1. So we will have two security realms in our domain one which we created and one is default security realm. Domain partition dp1 will have new security realm and other domain partitions will have default security realm. Default security realm has a user administrator with password administrator123. And new security realm will have user administrator with password welcome1. So Medrec application deployed in dp1 can be used by users of new security realm. You will not be able to login as an Admin in Medrec Application with default security realm user (administrator/administrator123).

In this lab we are going to perform the following operations:

- Creation of New Security Realm.
- Assigning a new Security realm to Domain Partition.
- Medrec application deployed in two different domain partitions which are using two different security realms in single domain.

Creating a New Security Realm

- i. The creation of Security Realm is more automated still inside WebLogic Console versus Fusion Middleware Control. This is why we will use WebLogic Console for that action. Go to Firefox and type the WebLogic Admin Console URL: <http://localhost:7001/console>.
- ii. Enter **weblogic/welcome1** as username/password then click on Login.

- iii. Under Domain Structure, click on **Security Realms**.

A screenshot of the Oracle WebLogic Server Administration Console 12c home page. The left sidebar shows a 'Domain Structure' tree with 'base_domain' expanded, showing 'Domain Partitions', 'Environment', 'Deployments', 'Services', 'Security Realms' (which is highlighted with a red box), 'Interoperability', and 'Diagnostics'. The main content area has a 'Home Page' header. It includes sections for 'Information and Resources' (with 'Helpful Tools' like 'Configure applications', 'GridLink', 'Dynamic Cluster', etc.), 'General Information' (with links to 'Task Descriptions', 'Documentation', and 'Support'), and 'Domain Configurations'. The top navigation bar includes 'Home', 'Log Out', 'Preferences', 'Record', 'Help', a search bar, and the user 'Welcome, weblogic'. The status bar at the bottom indicates 'Connected to: base_domain'.

- iv. Click on **New**.
- v. Enter **mynewrealm** as Name; check the box for “**Create default providers within new realm**” and “**Ignore Deploy Credential Mapping**” then click on **OK**.

Create a New Realm

Realm Properties

The following properties will be used to identify your new realm.

* Indicates required fields

What would you like to name your new realm?

* Name:

Valid security realms must include a number of providers, each of which is responsible for some aspect of the overall security framework. You can use either the WebLogic Server supplied providers or your own custom providers.

Create default providers within this new realm

To avoid overwriting new credential mapping information with old information in a weblogic-ra.xml deployment descriptor file, check the Ignore Deploy Credential Mapping setting below.

Ignore Deploy Credential Mapping

- vi. Click on **mynewrealm**.
- vii. Click on **Users and Groups -> Users** tab.

Settings for mynewrealm

Configuration **Users and Groups** Credential Mappings Providers Migration

Users Groups

This page displays information about each user that has been configured in this security realm.

Customize this table

Users (Filtered - More Columns Exist)

	Name	Description	Provider
There are no items to display			

New Delete Showing 0 to 0 of 0 Previous | Next

- viii. Click on New.
 - ix. Enter the following then click on **OK**.
- | | |
|-------------------|--------------------------|
| Name: | administrator |
| Description: | Domain Partition 2 users |
| Provider: | Default Authenticator |
| Password: | welcome1 |
| Confirm Password: | welcome1 |

Create a New User

OK Cancel

User Properties

The following properties will be used to identify your new User.

* Indicates required fields

What would you like to name your new User?

* Name: **administrator**

How would you like to describe the new User?

Description: **Domain Partition 2 users**

Please choose a provider for the user.

Provider: **DefaultAuthenticator**

The password is associated with the login name for the new User.

* Password: *********

* Confirm Password: *********

OK Cancel

Assign the mynewrealm security realm to domain partition dp1.

- i. Click on **Domain Partitions**, then on **Control** tab.
- ii. Check the box near dp1 and click on **Shutdown ->Force Shutdown Now**.

The screenshot shows the Oracle WebLogic Server Administration Console interface. On the left, there's a sidebar with 'Domain Structure' showing 'base_domain' with 'Domain Partitions' selected. The main area is titled 'Summary of Domain Partitions' with tabs for 'Configuration' and 'Control'. The 'Control' tab is active. A table lists three domain partitions: dp1, dp2, and dp3. For dp1, the 'Shutdown' dropdown is open, and 'Force Shutdown Now' is highlighted with a red box. The table also shows 'Default Target' (VT-Medrec-1 for dp1), 'Status of Last Action' (TASK COMPLETED for all), and 'Status' (RUNNING for all). Navigation links at the bottom show 'Showing 1 to 3 of 3'.

- iii. Once domain partition shutdown, click on dp1.
- iv. In **Configuration-> General** tab, Under Use Realm, select **mynewrealm** then click on **Save**.

The screenshot shows the 'Settings for dp1' configuration page. At the top, there are two tabs: 'Configuration' (highlighted with a red box) and 'Resource Groups', followed by other tabs like 'Deployments', 'Services', etc. Below these are sub-tabs: 'Work Manager', 'Concurrent Templates', 'Monitoring', 'Notes', 'General' (highlighted with a red box), 'Available Targets', 'File Systems', 'JTA', 'Concurrency', and 'Partition Work Manager'. There's a 'Save' button. The main content area is titled 'Select Default Targets:' and shows two panes: 'Available' (empty) and 'Chosen' (containing 'VT-Medrec-1'). To the right, there's a note: 'Select de These ta that does'. At the bottom, there's a 'Use Realm:' dropdown set to 'mynewrealm' (highlighted with a red box), a 'Primary Identity' field containing 'idd_dp1', and a note: 'The parti'. A vertical scroll bar is visible on the right side of the page.

- v. Click on **Domain Partitions**, then on **Control** tab.
- vi. Select the box near dp1 and click on **Start**.

Domain Partitions

Name	Default Target(s)	State	Status of Last Action
dp1	VT-Medrec-1	SHUTDOWN	TASK COMPLETED
dp2	VT-Medrec-2	RUNNING	TASK COMPLETED
dp3	VT-daytrader	RUNNING	TASK COMPLETED

Verified that we have two security realms in different domain partition in single domain

- i. Go to Firefox and type the URL: <http://localhost:7101/dp1/medrec/index.xhtml>
- ii. Under Administrator, click on Login.
- iii. Login with old security realm credential that is administrator/administrator123.
- iv. You must get “Incorrect username or password!”
- v. Login with new security realm credential that is administrator/welcome1.
- vi. Click on Logout. Click on Logout again.
- vii. Go to Firefox and type the URL: <http://localhost:7101/dp2/medrec/index.xhtml>
- viii. Under Administrator, click on Login.
- ix. Login with new security realm credential that is administrator/welcome1.
- x. You must get “Incorrect username or password!”
- xi. Login with old security realm credential that is administrator/administrato123.
- xii. Click on Logout. Click on Logout again.

Here we learned how you can have two security realms in a domain. So one of your domain partitions can use default security realm and other can use custom security realm created by you in same domain.

LAB 4: EXPORT/IMPORT DOMAIN PARTITION

Overview

Exporting and importing partitions let WLS system administrators easily move partitions from one domain to another, including the applications that are deployed to the partition. This feature is useful for replicating partitions across the domains and for moving domains from a development to a testing then production environment.

Exporting a domain partition creates a partition backup and stores it in an archived format. You can export a domain partition from source domain with its entire configuration and data. With few configuration changes, you can then import the partition archive into another instance of multi-tenant WLS (the target domain). You might need to update any domain dependencies, such as targets and security realms, and optionally update other attributes in the partition configuration to make it valid.

When a partition is exported from the source domain it is packaged in a partition archive. Included in the partition archive is:

- The partition configuration.
- Any resource group contained in the partitions.
- Any resource group templates referred to by those resource groups.
- The contents of the file system, <partition-file-system>/config directory.
- Optionally, application binaries and configuration for applications deployed to the partition.

No application runtime state or application-specific runtime configuration is included in the partition archive. Examples of what would not be exported are JMS messages in queues, users in an embedded LDAP realm.

In this Lab, We will create a Non-JRF domain dev_domain and configure it with all required resources for Medrec application. You will remove domain partition dp1 from base_domain. As this domain partition is targeted to Virtual Target VT-Medrec-1 and we are going to import a new domain partition on this Virtual target. So we need to remove this domain partition dp1 for this Lab2.

We are going to learn the following:

- Exporting a domain partition from a Non-JRF domain dev_domain and importing it to a Restricted JRF domain base_domain.

Note: To simplify import/export both domains contain Virtual Target with the same name. In our case, base_domain and dev_domain has VT-Medrec-1 as Virtual Target. It is possible to make import/export without that restriction. To import partition and bind it to virtual target of different name, you should modify settings inside associated “*-attributes.JSON” file

Please remember that Virtual Target may be assigned to the one and only one domain partition. This is why before importing please ensure that original domain partition “dp1” was completely removed from domain configuration (don’t miss step c on page 47!)

Stop and remove domain partition dp1 from base_domain.

- In Fusion Middleware Control <http://localhost:7001/em>, Click on **WebLogic Domain -> Environment -> Domain Partition**.
- Check the **box** near **dp1** then click on **Control -> Stop->Force Stop Now**. On the Confirmation Screen Click on **OK**. Once you see the message "**Partition state after the operation is SHUTDOWN**" then click on **Close**.

Name	Status	OTD Partition	Realm	Default Targets	Available Targets
dp1	Up (3)	dp1	vtrealm	VT-Medrec-1	VT-Medrec-1
dp2	Running	dp2	vtrealm	VT-Medrec-2	VT-Medrec-2
dp3	Running	dp3	vtrealm	VT-daytrader	VT-daytrader

- c. Check the box near **dp1** and make it highlighted then click on **Delete**. In Delete Domain Partition Screen, click on OK.

The screenshot shows the Oracle Enterprise Manager interface for a WebLogic Domain named 'base_domain'. The 'Domain Partitions' section is displayed. Two pie charts are shown: one for 'Status' (Up 2, Down 1) and one for 'State' (Running 2, Shutdown 1). Below the charts is a table of domain partitions. The row for 'dp1' is selected and has a red box around its 'Name' column. The 'Delete' button in the toolbar above the table is also highlighted with a red box. The table columns are: Name, Status, State, OTD Partition, Realm, Default Targets, and Available Targets. The data in the table is:

Name	Status	State	OTD Partition	Realm	Default Targets	Available Targets
dp1		Shutdown		mynewrealm	VT-Medrec-1	VT-Medrec-1
dp2		Running			VT-Medrec-2	VT-Medrec-2

- d. Go to Firefox and type the URL: <http://localhost:7101/dp1/medrec/>
e. Confirm that page return “Error 404—Not Found”.

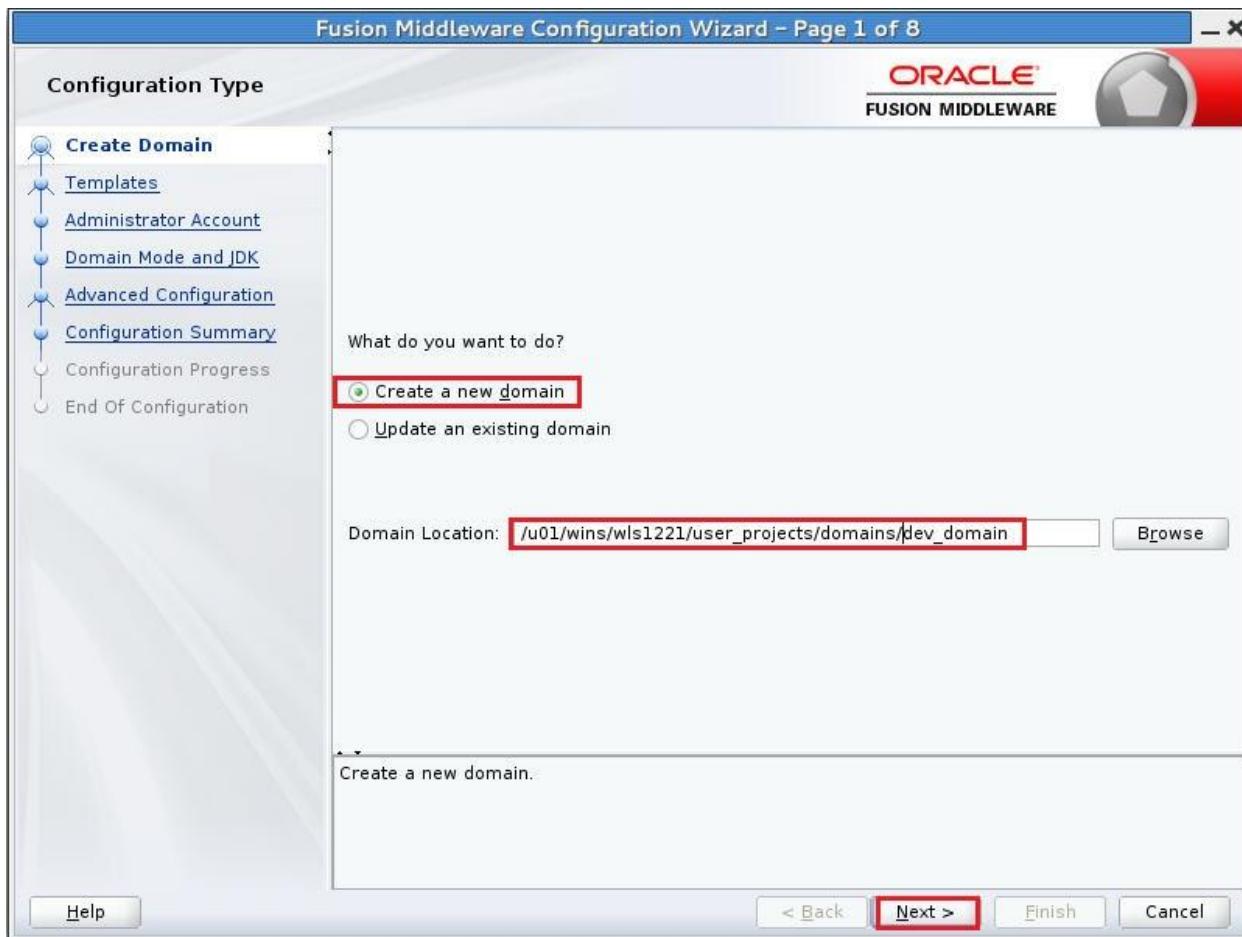

The screenshot shows a Firefox browser window with the following details:

- Address bar: localhost:7101/dp1/medrec/ (highlighted with a red box)
- Page title: Error 404--Not Found
- Text on the page: "Error 404--Not Found"
- Text below the error message: "From RFC 2068 Hypertext Transfer Protocol -- HTTP/1.1:"
- Section header: "10.4.5 404 Not Found"
- Description: "The server has not found anything matching the Request-URI. No indication is given of whether the condition is temporary or permanent."
- Text at the bottom: "If the server does not wish to make this information available to the client, the status code 403 (Forbidden) can be used instead. The 410 (Gone) status code SHOULD be used if the server knows, through some internally configurable mechanism, that an old resource is permanently unavailable and has no forwarding address."

Create a new dev single server (Admin Server) domain

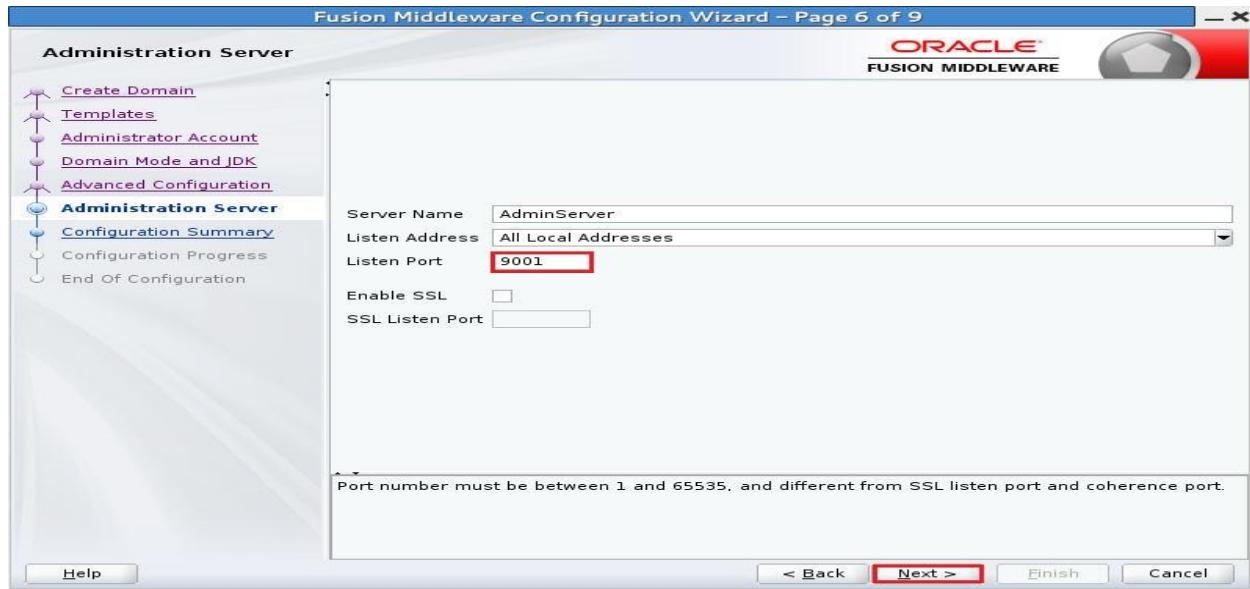

We are going to create a domain which contains only Admin Server, as the previous domain base_domain is created with RESTRICTED-JRF template. But this domain will be created by default template that is with basic template.

- a. Open a new tab.
- b. cd /u01/wins/wls1221/oracle_common/common/bin/
- c. ./config.sh
- d. Select “Create a new domain” and Enter “/u01/wins/wls1221/user_projects/domains/dev_domain” as Domain Location then click on **Next**.

- e. Leave Default on Templates then click on **Next**.
- f. Enter **weblogic/welcome1** as Name/Password in Administrator Account then click on **Next**.
- g. Leave default on Domain Mode and JDK then click on **Next**.
- h. Check the box near to Administration Server then click on **Next**.

- i. In Administration Server, Enter 9001 as Listen Port then click on **Next**.

- j. Click on **Create** then click on **Next**. Click on **Finish**.

Configure domain for Medrec Application.

In Lab 2, you configure the domain using Fusion Middleware console, but here we are going to configure domain using Weblogic Admin Console. The operation related to Multitenancy, we can also perform using WebLogic Admin Console.

- cd /u01/wls/wls1221/user_projects/domains/dev_domain/
- ./startWebLogic.sh
- In Tab, Click on Terminal -> Set Title, Enter **dev_admin** as Title then Click on OK.
- Go to Firefox and type the WebLogic Admin Console URL:
<http://localhost:9001/console>.
- Enter **weblogic/welcome1** as **Username/Password** then click on Login.
- Creation of Virtual Target.
 - Click on **Environment -> Virtual Targets**.

- ii. Click on New.
- iii. Enter the following then click on **OK**.

Name:	VT-Medrec-1 (Both Virtual Target Name will be same)
Target:	Admin Server
URI Prefix:	/devDP

Home >Summary of Virtual Targets

Create a New Virtual Target

OK | **Cancel**

Virtual Target Properties

The following properties will be used to identify your new virtual target.

What would you like to name your new virtual target?

Name: **VT-Medrec-1**

Select one managed server or cluster on which you would like to deploy this virtual target

Target: **AdminServer**

Enter one or more hostnames, each on separate lines within the text box.

Host Names:

Enter an URI prefix starting with a / (forward slash).

URI Prefix: **/devDP**

- g. Creation of Domain Partition.
- i. Click on **Domain Partition -> New**.

ORACLE WebLogic Server Administration Console 12c

Summary of Domain Partitions

Configuration | Control

Domain partitions are an administrative and runtime slice of a WebLogic domain that is dedicated to running application instances and related resources for a tenant.

This page summarizes the domain partitions that have been configured in the current WebLogic Server domain.

Customize this table

Domain Partitions (Filtered - More Columns Exist)

New	Delete	Import	Export	Showing 0 to 0 of 0 Previous Next
Name	Resource Groups	Default Target(s)	State	
There are no items to display				

New	Delete	Import	Export	Showing 0 to 0 of 0 Previous Next
------------	---------------	---------------	---------------	-------------------------------------

- ii. Enter **Medrec-Dev** as Name and **unchecked** the box for **Default Resource Group**. Click on **Next**.
- iii. Check the box for **VT-Medrec-1** then click on **Next**.
- iv. In Default Targets, Move **VT-Medrec-1** to Chosen. Click on **Finish**.

Create a New Domain Partition

Back | Next | **Finish** | Cancel

Domain Partition Configuration

The following properties will be used to configure your new domain partition.

Default Targets:

Available:	Chosen:
[Empty]	<input checked="" type="checkbox"/> VT-Medrec-1

Security: Not assigned
Realm:

Partition File System

- v. In **Domain Partition -> Control tab**, check the box near Medrec-Dev and click on Start.

Summary of Domain Partitions

Configuration | **Control**

This page lists the state of the domain partitions in this WebLogic Server domain.

Name	Default Target(s)	Status	Status of Last Action
Medrec-Dev	VT-Medrec-1	SHUTDOWN	None

Start | Resume | Suspend | Shutdown | Showing 1 to 1 of 1 Previous | Next

Start | Resume | Suspend | Shutdown | Showing 1 to 1 of 1 Previous | Next

h. Creation of Resource Group

- i. Click on domain partition **Medrec-Dev**.
- ii. Click on **Resource Groups -> Configuration tab** then click on New.

This page summarizes the resource groups of a domain partition that have been configured in the current WebLogic Server domain.

Name	Resource Group Template	Effective Targets	State	Notes
There are no items to display				

- iii. Enter **appRG** as Name, Leave others as default then click on **OK**.

Note: We have created script through which you can create the remaining resources, you need to run the file **MedrecInMedrec-Dev.sh** inside **/u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab4**, and then you can directly go to **Exporting the domain partition** section.

i. Creation of Data Source.

- i. Click on **dev_domain -> Services -> Data Sources** then click on **New-> Generic Data Sources**.

A JDBC data source is an object bound to the JNDI tree that provides database connectivity through a pool of JDBC connections. Applications can look up a data source on the JNDI tree and then borrow a database connection from a data source.

Type	JNDI Name	Targets	Scope	Domain Partitions
There are no items to display				

- ii. Enter the following and click on **Next**.

Name: MedRecGlobalDataSourceXA
JNDI Name: jdbc/MedRecGlobalDataSourceXA
Scope: appRG in Medrec-Dev
Database Type: Oracle

Create a New JDBC Data Source

Mail Session Properties

The following property will be used to identify your new mail session.

* Indicates required fields

What would you like to name your new mail session?

* Name: **MedRecMailSession**

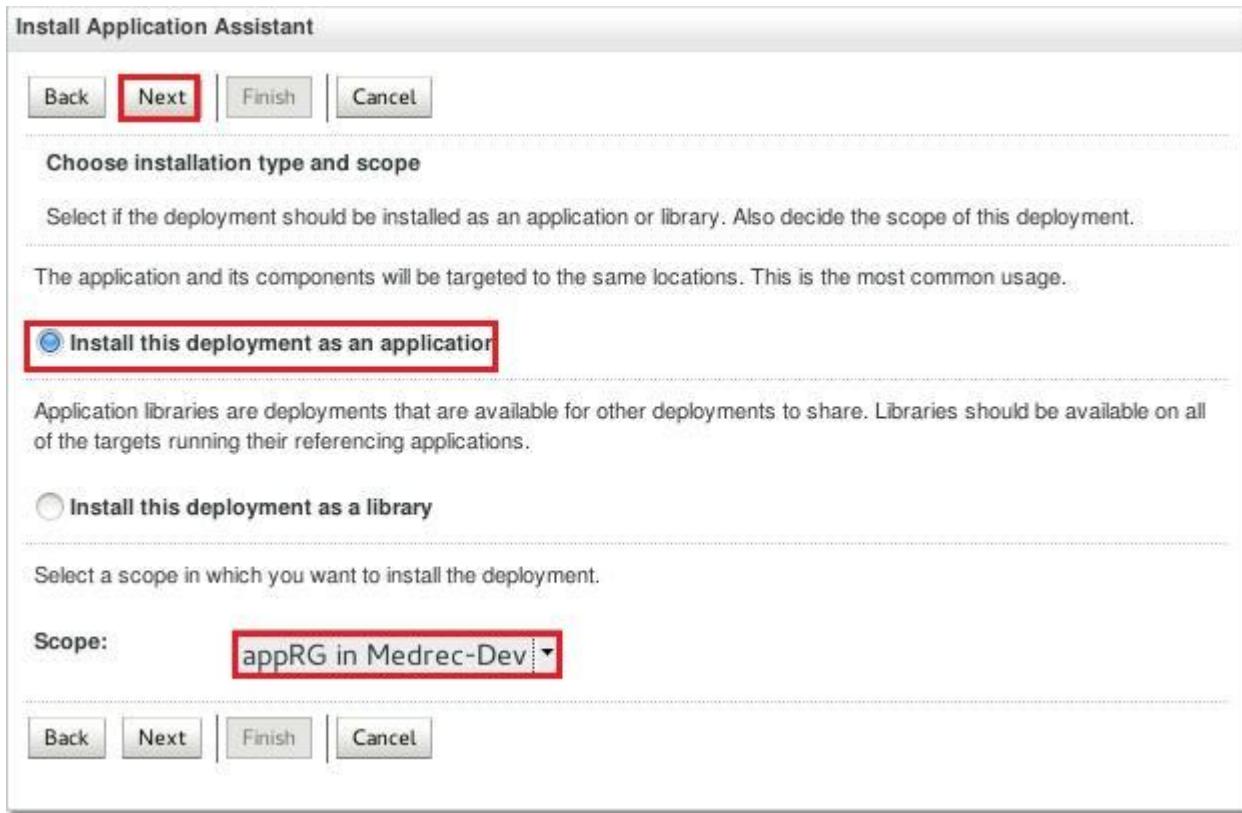

* JNDI Name: **mail/MedRecMailSession**

What scope do you want to create your mail session in ?

Scope: **appRG in Medrec-Dev**

- iv. Click on **Finish**.
- p. Deployments of Application
- Click on **Deployments** then on **Install**.
 - Select the medrec.ear application from the Path /u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab4/ then click on **Next**.

- iii. Select “**Install this deployment as an application**” and “**appRG in Medrec-Dev**” as Scope then click on **Next**. Click on **Finish**.

- iv. Click on **Install** then Select the physician.ear application from the Path /u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab4/ then click on **Next**.
- v. Select “**Install this deployment as an application**” and “**appRG in Medrec-Dev**” as Scope then click on **Next**. Click on **Finish**.
- vi. Click on **Install** then Select the chat.war application from the Path /u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab4/ then click on **Next**.
- vii. Select “**Install this deployment as an application**” and “**appRG in Medrec-Dev**” as Scope then click on **Next**. Click on **Finish**.
- viii. Go to Firefox and type the URL: <http://localhost:9001/devDP/medrec/> and confirm the execution of application.

Exporting the domain partition

- Go back to admin console <http://localhost:9001/console/> of dev_domain.
- Click on **Domain Partition**, and then check the box near to “**Medrec-Dev**” then click on Export.

Summary of Domain Partitions

Name	Resource Groups	Default Target(s)	State
Medrec-Dev	appRG	VT-Medrec-1	RUNNING

- Select the box for “**Include Application Bits**” and enter **/home/oracle/Desktop** as Path then click on **OK**.

Export a Domain Partition

OK Cancel

Export a Domain Partition

Select or enter the directory where the domain partition archive should be placed. Each domain partition should be located in its own directory. The domain partition archive will be overwritten if it already exists. Other files in the directory may be overwritten as well.

Domain: Medrec-Dev
Partition Name: Medrec-Dev

Do you want to include the installed applications in the exported ZIP file?

Include Application Bits

What is the full path to the key file you want to use to encrypt attributes in the partition archive?

Full path to the Key File:

Where do you want the domain partition archive to be placed?

Path: /home/oracle/Desktop

- Go to Desktop and Verify the Creation of **Medrec-Dev-attributes.json** and **Medrec-Dev.zip** file.

Importing the domain partition

- Go back to EM console of base_domain. Go to Firefox and type the WebLogic Admin Console URL: <http://localhost:7001/em>.
- Enter **weblogic/welcome1** as Username/Password and click on Login.
- Click on **WebLogic Domain-> Environment ->Domain Partition**.
- Click on Import. Click on **Browse** button, Select the file **Medrec-Dev.zip** from **/home/oracle/Desktop** directory then click on **OK**.

The screenshot shows the Oracle Enterprise Manager Fusion Middleware Control 12c interface. The top navigation bar includes 'WebLogic Domain' and 'weblogic'. The main content area is titled 'base_domain'. Under 'Domain Partitions', there is a pie chart showing two green circles: one labeled 'Up (2)' and another labeled 'Running(2)'. Below the chart is a table with columns: Name, Status, State, OTD Partition, Realm, Default Targets, and Available Targets. Two rows are listed: dp2 (Status Up, State Running, Default Targets VT-Medrec-2, Available Targets VT-Medrec-2) and dp3 (Status Up, State Running, Default Targets VT-daytrader, Available Targets VT-daytrader). A red box highlights the 'Import' button in the toolbar above the table. The status bar at the bottom right shows 'Nov 5, 2015 9:32:21 PM PST'.

The screenshot shows the 'Import Domain Partition' dialog box. It contains instructions: 'Use this dialog to import a partition archive into the domain. The archive was previously generated by exporting a partition.' Below this is a text input field 'Import domain partition from zip file' containing the path '/home/oracle/Desktop/Medrec-Dev.zip', which is also highlighted with a red box. To the right of this input field is a 'Browse...' button. There are three checkboxes at the bottom: 'Overwrite existing resource group templates' (unchecked), 'Override domain partition name (optional)' (unchecked), and 'Full path to the key file used to decrypt attributes (optional)' (unchecked). At the bottom right are 'OK' and 'Cancel' buttons, with 'OK' also highlighted with a red box.

- e. Initially it will have State “**Unknown**”. Wait for 1 or 2 minute, click on Refresh icon to get the current state.
- f. Once the status for **Medrec-Dev** domain partition is **Shutdown**, check the box, near Medrec-Dev then click on **Control -> Start**. Click on **Close**. Click on the Refresh icon to get the current state.

The screenshot shows the Oracle Enterprise Manager interface for a WebLogic Domain named 'base_domain'. At the top, there are two pie charts: one for 'Status' showing 'Up (3)' and another for 'State' showing 'Running(3)'. Below these are two navigation links: 'Getting Started with Multi-Tenancy' and 'Hide Pie Chart'. A table lists three domain partitions:

Name	Status	State	OTD Partition	Realm	Default Targets	Available Targets
dp2	Up	Running			VT-Medrec-2	VT-Medrec-2
dp3	Up	Running			VT-daytrader	VT-daytrader
Medrec-Dev	Up	Running			VT-Medrec-1	VT-Medrec-1

- g. Go to Firefox and type the URL: <http://localhost:7101/dp1/medrec/>
- h. Click on “**Getting Started!**” Under Administrator, click on Login.
- i. Enter **administrator/administrator123** as Username/Password then click on Sign in.
- j. Click on Logout. Click on Logout again.

Note: As we have VT-Medrec-1 as Virtual target in both the domains `base_domain` and `dev_domain`. In `base_domain`, we have added administrator user to default security realm. So as this domain partition becomes part of this domain. It also uses the default security realm. Here you are accessing the application using `/dp1` in the URL because, we have Virtual target VT-Medrec-1 has `/dp1` as URI, So Virtual target definition do not change during import.

- k. Come back to tab **dev_admin**.
- l. Stop the Weblogic Server running in `dev_domain`, by pressing **Ctrl +C** in tab in which Admin Server is running. Close the Tab.

LAB 5: RESOURCE CONSUMPTION MANAGEMENT

Overview

When applications that are deployed to multiple collocated Domain Partitions, access shared resources (low level resources such as CPU, network, storage) two key problems are likely to be faced:

- Contention and unfairness during allocation: Multiple request for a Shared resources results in contention and interference. Abnormal resource consumption requests may happen due to benign reasons (high traffic-genuine or DDoS), misbehaving, buggy applications or malicious code. These requests could overload the capacity of shared resources, thereby preventing another consumer's access to the resource.
- Variable performance leading to potential Service Level Agreement (SLA) violations: From a cloud operations perspective, performance for different collocated consumers.

It is therefore critical to manage and isolate access to shared resources in the WebLogic application Server by domain partition to ensure fairness in allocation, prevent contention/interferences of access to shared resources and to provide consistent performance for multiple co resident tenants. The Resource Consumption Management (RCM) feature in WebLogic 12.2.1 Multitenancy allows WebLogic System administrator to specify resource consumption management policies (allows the specification of constraints, recourse actions and notification) on shared resources such as CPU, Heap, File and Network. You can create resource manager based on the following parameter:

- Retained Heap
- CPU Time
- Open File Descriptor

You need to provide the value for below action, as it reaches to that value. It will trigger the following action:

- | | |
|----------------|---|
| Notify: | Inform administrator that a threshold has been crossed. |
| Slow: | Reduce Partition ability to consume more resources. |
| Stop: | Initiate the shutdown sequence for the offending partition. |

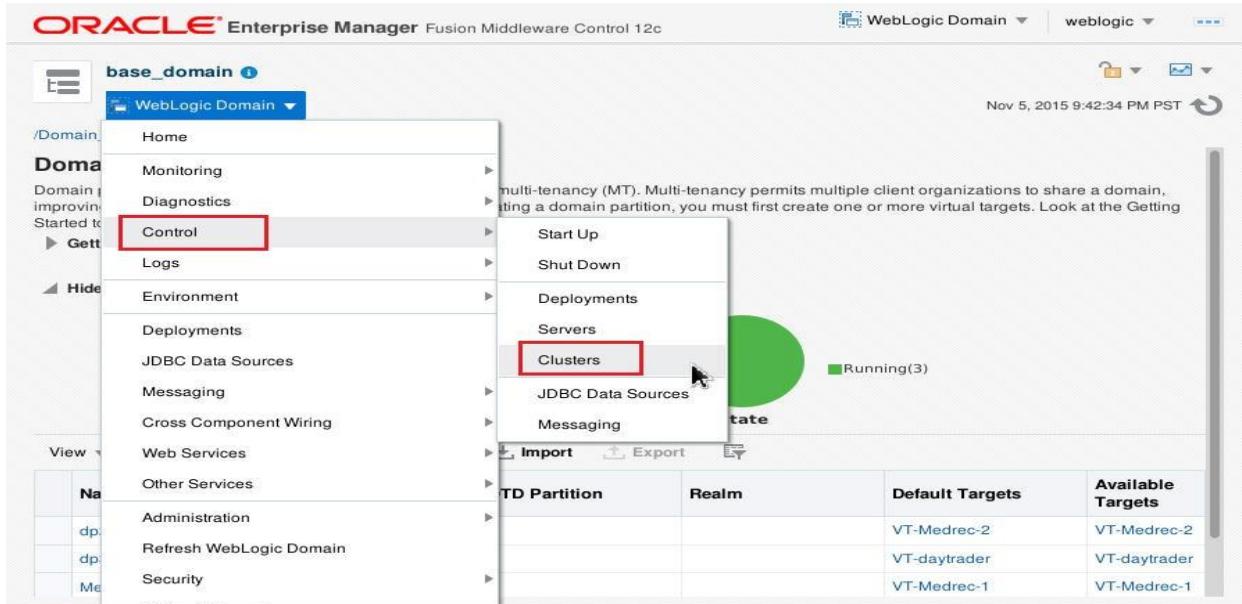

In this lab first we create a resource manager based on the Heap size then we specify the values with respective actions. So as following values reaches that action get triggered. We will use sample application through which we can modify the value of Heap size and we will see the action associated.

In this lab we are going to perform the following operations:

- Enabling RCM by adding extra arguments in Server Java Arguments.
- Creating Resource manager on the basis of Heap Size.
- Assign Resource manager to a Domain Partition.
- Running an example to understand the functioning of RCM.

Enabling RCM by adding extra arguments in Server JAVA_OPTION Arguments

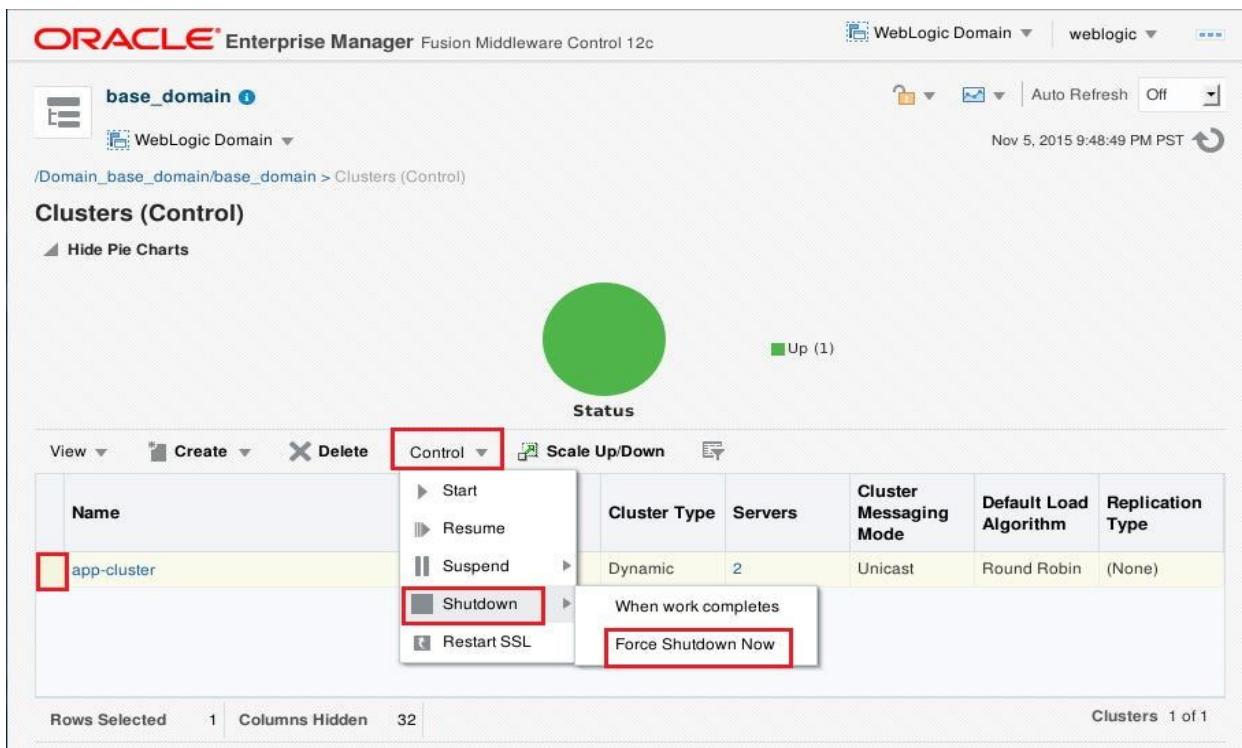

- Go to Firefox and type the Fusion Middleware Control Console URL:
<http://localhost:7001/em>
- Click on **WebLogic Domain -> Control -> Clusters.**

The screenshot shows the Oracle Enterprise Manager Fusion Middleware Control 12c interface. The left sidebar has 'Domain' selected. Under 'Control', 'Clusters' is highlighted and selected. A tooltip explains multi-tenancy (MT) and virtual targets. The main panel shows a pie chart indicating 3 clusters are running. Below it is a table:

TD Partition	Realm	Default Targets	Available Targets
		VT-Medrec-2	VT-Medrec-2
		VT-daytrader	VT-daytrader
		VT-Medrec-1	VT-Medrec-1

- Check the boxes near app-cluster then click on **Control -> Shutdown ->Force Shutdown Now**. Click on **Forcibly Shutdown Servers**.

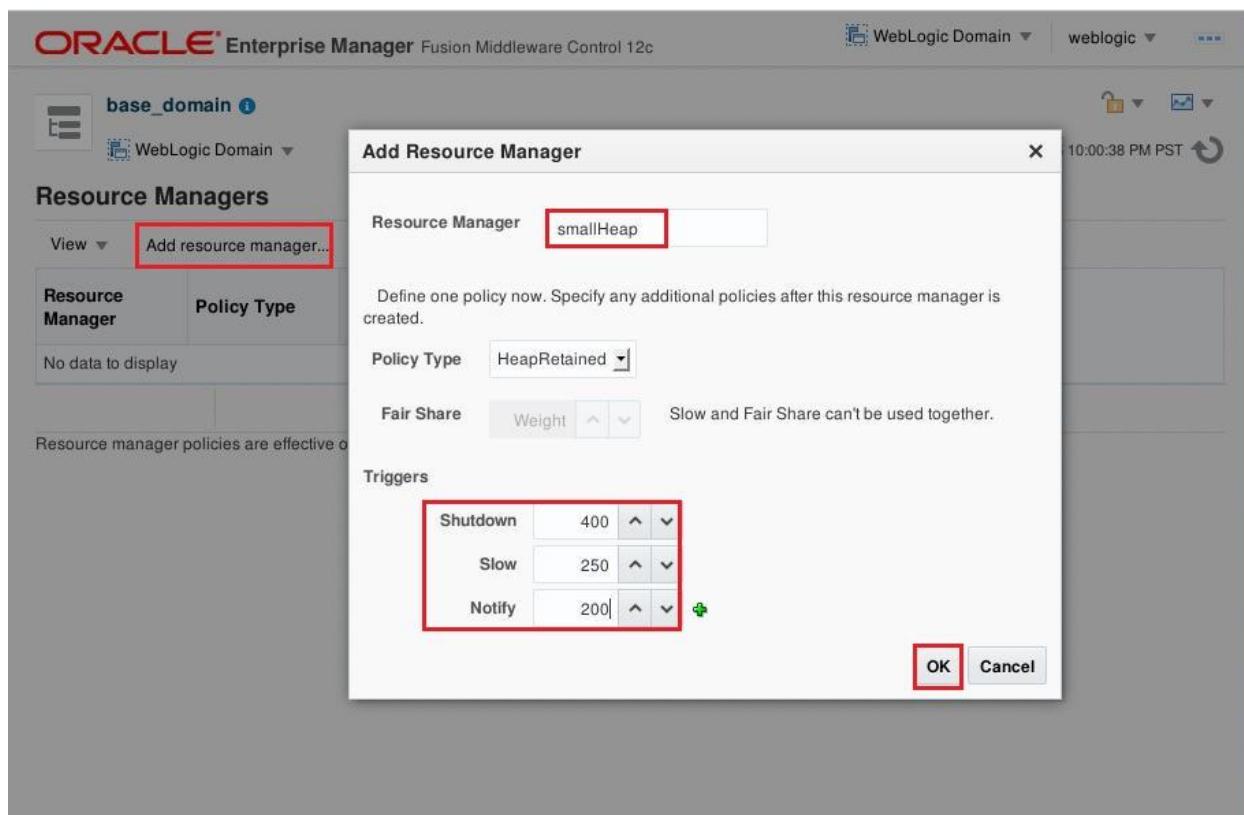

The screenshot shows the 'Clusters (Control)' page. The 'Control' dropdown is open, and the 'Shutdown' option is selected. A sub-menu shows 'When work completes' and 'Force Shutdown Now'. The table below lists one cluster:

Name	Cluster Type	Servers	Cluster Messaging Mode	Default Load Algorithm	Replication Type
app-cluster	Dynamic	2	Unicast	Round Robin	(None)

- d. Open a new tab.
- e. cd /u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab5
- f. cp setDomainEnv.sh /u01/wins/wls1221/user_projects/domains/base_domain/bin/
- g. In above command we have modified the JAVA_OPTIONS as specified below.
JAVA_OPTIONS="-XX:+UnlockCommercialFeatures -XX:+ResourceManagement -XX:+UseG1GC \${JAVA_OPTIONS} \${JAVA_PROPERTIES}"
- h. cd /u01/wins/wls1221/user_projects/domains/base_domain/bin/
- i. ./setDomainEnv.sh
- j. Go back to Fusion middleware control then click on **WebLogic Domain > Control -> Clusters**.
- k. Check the box near to app-cluster-1 to make it highlighted and then click on **Control -> Start -> Start Servers**.
- l. tail -f /u01/wins/wls1221/user_projects/domains/base_domain/servers/app-cluster-1/logs/app-cluster-1.log
- m. In this tab, Click on Enter Terminal -> Set Title and app-cluster-1 then click on **OK**.
We will use these logs to monitor resource consumption manager lab.

Creating a Resource Manager and Configuring Resource Manager for a domain partition

- a. Go to FMW control <http://localhost:7001/em>
 - b. Enter weblogic/welcome1 as Username/Password then click on Login.
 - c. Click on **WebLogic Domain->Environment -> Resource Consumption Managers**.
 - d. Click on **Add Resource Manager** and Enter the following value then click on **OK**
- | | |
|-------------------|--------------|
| Resource Manager: | smallHeap |
| Policy Type: | HeapRetained |
| Shutdown: | 400 |
| Slow: | 250 |
| Notify: | 200 |

Associate the Resource Manager with Medrec-Dev domain partition.

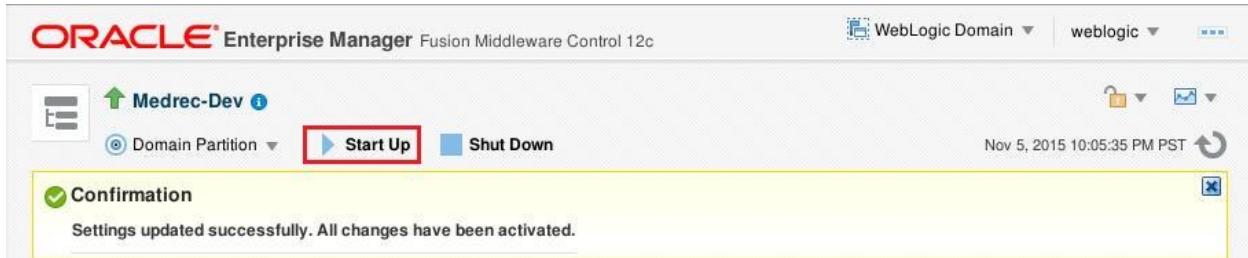

- Click on **WebLogic Domain -> Environment->Domain Partition** then click on **Medrec-Dev**.
- Click on **Domain Partition ->Administration -> Resource Sharing**.

The screenshot shows the Oracle Enterprise Manager interface for a 'Medrec-Dev' domain. The left sidebar has sections for Monitoring, Resource, Deployment, and Administration. Under 'Administration', the 'Resource Sharing' option is highlighted with a red box. The main panel displays 'JDBC and JTA Usage' and 'Resource Usage' metrics, with 'Resource Sharing' listed under 'General'.

- Under **Resource Manager Configuration**, and Select “**Use a Resource Manager configured for the domain**” and choose “**smallHeap**” then click on **Save**.

The screenshot shows the 'Partition Work Manager Configuration' and 'Resource Manager Configuration' pages for the 'Medrec-Dev' partition. In the 'Partition Work Manager Configuration', the 'No Partition Work Manager' option is selected. In the 'Resource Manager Configuration', the 'Use a resource manager configured for the domain: smallHeap' option is selected and highlighted with a red box.

- d. Click on **Start Up** near Domain partition. Click on Close.

- e. Open a new tab.
- f. cd /u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab5
- g. ./DeployHeap.sh
- h. Close the tab.
- i. Go back to Firefox and type the URL: <http://localhost:7101/dp1/heapApp/>
- j. Enter 160 in **Allocate Heap** then click on Submit then observe the logs of app-cluster-1 managed server. After that no Warning message should be observed in the log as we didn't cross the boundary of any RCM action.

- k. Enter 50 in **Allocate Heap** then click on Submit then observe the logs of app-cluster-1 managed server. We will cross the first ("Notify") boundary of RCM actions. So we should see associated log message.

```
####<Nov 5, 2015 10:12:23 PM PST> <Notice> <RCM> <localhost.localdomain> <app-cluster-1> <Thread-73> <weblogic> <> <f11a4b64-f694-4af6-8b28-7f32a9f96d47-0000003c> <1446790343249> <[Notifying Quota Reached For Partition: Medrec-Dev] [severity-value: 32] [rid: 0] [Previous Usage: 207153216] [partition-id: cd3147a2-5e49-4731-bad1-94689b69cd5b] [Resource Name: com.oracle.weblogic.rcm.framework.base.HeapRetainedResourceAttributes] [Current Usage: 215825984] [partition-name: Medrec-Dev]> <BEA-2165799> <Resource Consumption Management Notification Message: Given quota has been reached for the partition and a notify action has been executed.>
```

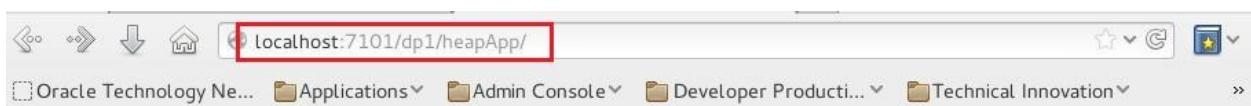

- l. Enter 50 in **Allocate Heap** then click on Submit then observe the logs of app-cluster-1 managed server. We crossed the second limit ("Slow") so the associated message should be seen in the log.

```
####<Nov 5, 2015 10:14:04 PM PST> <Notice> <RCM> <localhost.localdomain> <app-cluster-1> <Thread-72> <weblogic> <> <f11a4b64-f694-4af6-8b28-7f32a9f96d47-0000003d> <1446790444011> <[Slow Action Quota Reached For Partition: Medrec-Dev] [Current Usage: 299741448] [severity-value: 32] [Previous Usage : 298576032] [Was Required action to Slow the Partition is executed?: true] [Resource Name: com.oracle.weblogic.rcm.framework.base.HeapRetainedResourceAttributes] [partition-id: cd3147a2-5e49-4731-bad1-94689b69cd5b] [partition-name: Medrec-Dev] [rid: 0]> <BEA-2165800> <Resource Consumption Management Slow Message: Given quota has been reached for the partition and a slow action has been executed.>
```

- m. Enter 150 in **Allocate Heap** then click on Submit then observe the logs of app-cluster-1 managed server. This will exceed the limit of memory allowed to be used by that partition. So to prevent other partitions from suffering of lack of memory WebLogic will shutdown the partition.

```
####<Nov 5, 2015 10:15:15 PM PST> <Notice> <RCM> <localhost.localdomain> <app-cluster-1> <Thread-74> <weblogic> <> <f11a4b64-f694-4af6-8b28-7f32a9f96d47-0000003e> <1446790515227> <[severity-value: 32] [Proposed Usage: 459764600] [rid: 0] [partition-id: cd3147a2-5e49-4731-bad1-94689b69cd5b] [Shutdown Action Quota Reached For Partition: Medrec-Dev] [Resource Name: com.oracle.weblogic.rcm.framework.base.HeapRetainedResourceAttributes] [Current Usage: 442240104] [partition-name: Medrec-Dev]> <BEA-2165801> <Resource Consumption Management Shutdown Message: Given quota has been reached for the partition and a shutdown action has been executed.>
```

- n. Refresh the page, <http://localhost:7101/dp1/heapApp/> which return 404 and confirm shutdown of the domain partition Medrec-dev in managed server 1.

Error 404--Not Found

From RFC 2068 Hypertext Transfer Protocol -- HTTP/1.1:

10.4.5 404 Not Found

The server has not found anything matching the Request-URI. No indication is given of whether the condition is temporary or permanent.

If the server does not wish to make this information available to the client, the status code 403 (Forbidden) can be used instead. The 410 (Gone) status code SHOULD be used if the server knows, through some internally configurable mechanism, that an old resource is permanently unavailable and has no forwarding address.

Note: As this domain partition is target to virtual target which is target at cluster which consists of two managed servers. So this domain partition stopped working on managed server 1, but if you access the application on managed server 2, you still will be able to access the application in this domain partition. If similar things happen in managed server 2 and domain partition shutdown on managed server 2 as well, then domain partition will be shutdown.

LAB 6: OTD INTEGRATION AND RESOURCE MIGRATION

Overview

This lab describes how Oracle Traffic Director can front end a WLS MT Deployment topology for a large enterprise, providing an integrated, end to end administration experience for the server life cycle, and partition management.

For this lab, we installed OTD in Collocated mode. We create one domain otd_domain for OTD instance then we show how to register an OTD instance in WebLogic Domain base_domain. Then we show how you can create partition front ended by OTD.

Oracle Traffic Director has an administration plug in which is responsible for handling life cycle events and automatically configuring Oracle Traffic Director with the corresponding configuration

When you create a WLS MT partition, a corresponding Oracle Traffic Director partition is created for you. The Oracle Traffic Director partition is simply a grouping with the same name as the partition and the resource group. The life cycle of an Oracle Traffic Director partition and its corresponding artifacts are linked to the life cycle of the partition.

The Oracle Traffic Director console provided a partition table with the list of Oracle Traffic Director Partitions to identify the Oracle Traffic director artifacts that are mapped to partitions and resource groups.

Oracle Traffic Director Artifacts map to WebLogic Server MT artifacts as follows:

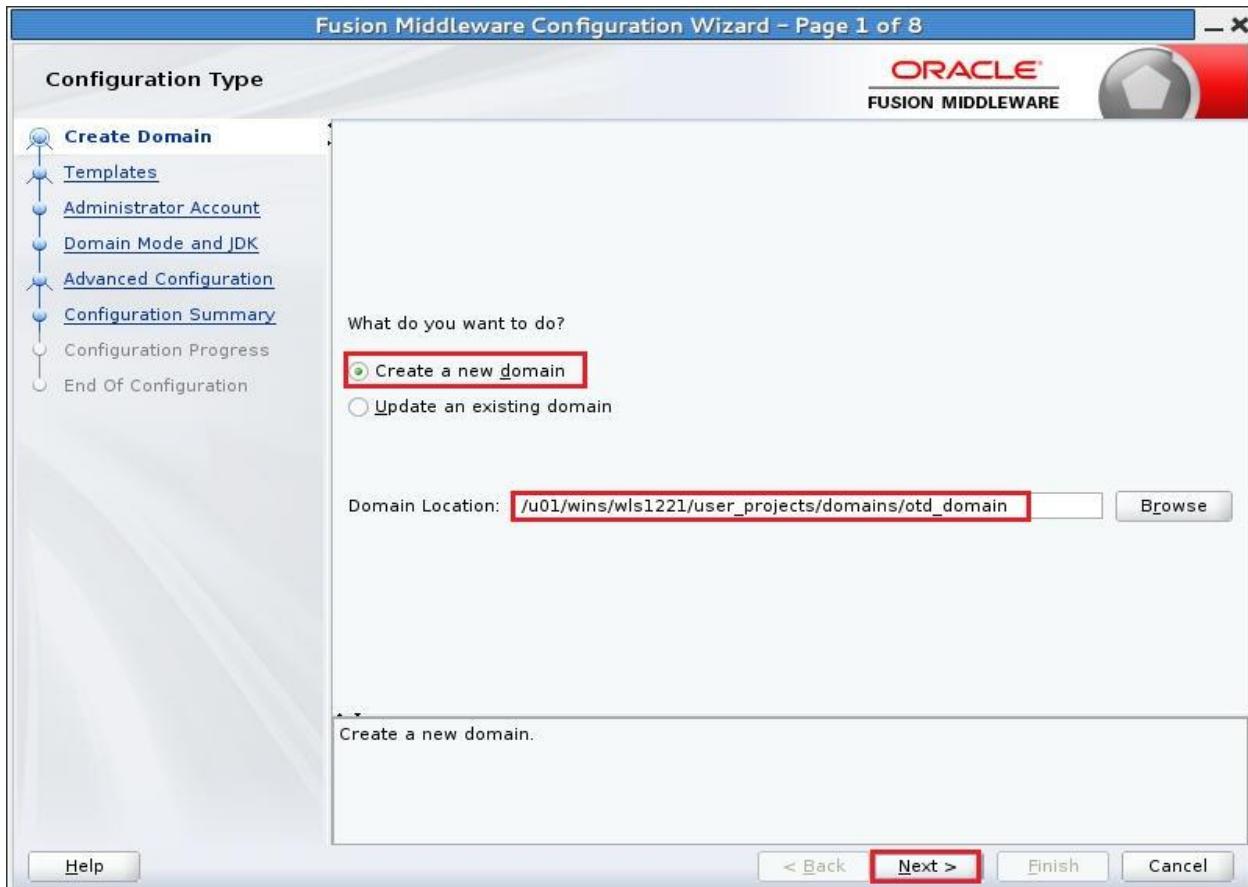

- Each cluster maps to an origin server pool.
- The hostnames of a virtual target that is associated with the partitions and/or resource groups maps to a virtual server.
- Each partition or resource group maps to a route within the virtual server corresponding to the hostname of the virtual target.

In this lab, we are going to perform the below operations.

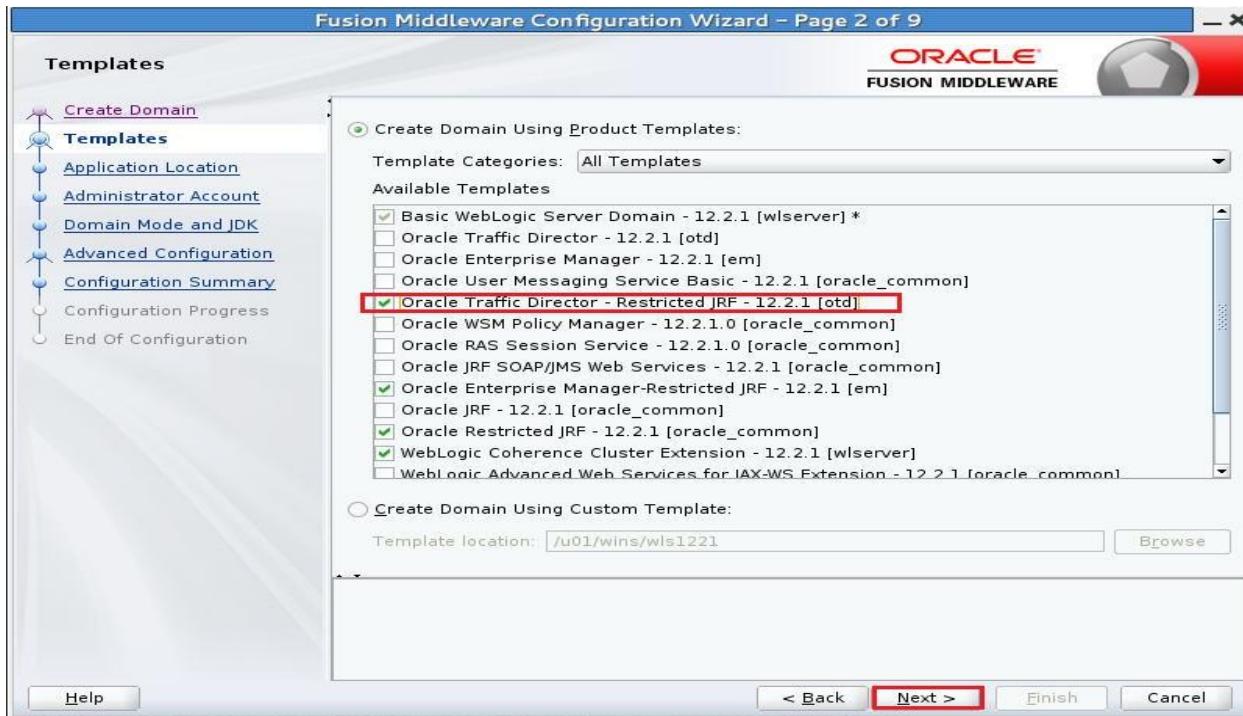

- We create an OTD domain; in that domain we create a machine and OTD configuration.
- We register that OTD Runtime instance inside the WebLogic domain.
- We create a domain partition front ended by OTD.
- We deploy a simple application to verify the OTD integration with domain partition.
- We migrate a resource group from one cluster to other cluster.

Create OTD Restricted JRF Domain

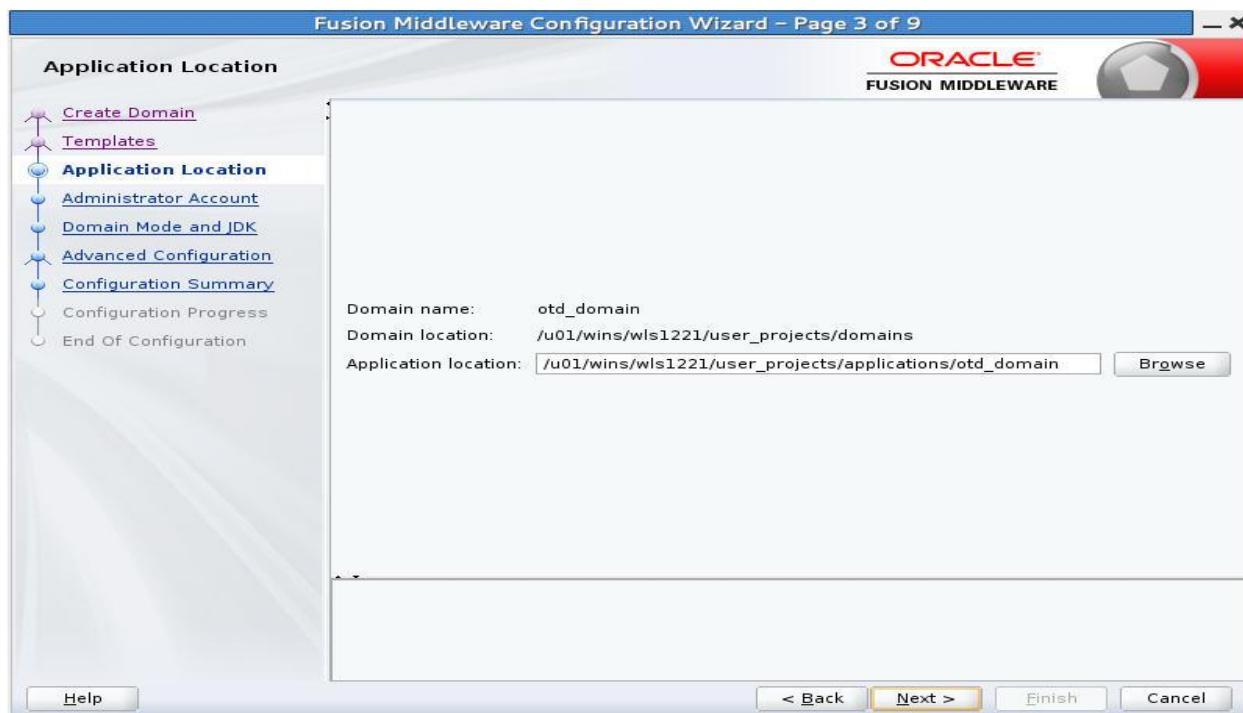

- a. Open a new tab.
- b. cd /u01/wins/wls1221/oracle_common/common/bin/
- c. ./config.sh
- d. Select “Create a new domain” and enter “**/u01/wins/wls1221/user_projects/domains/otd_domain**” as Domain Location then Click on Next.

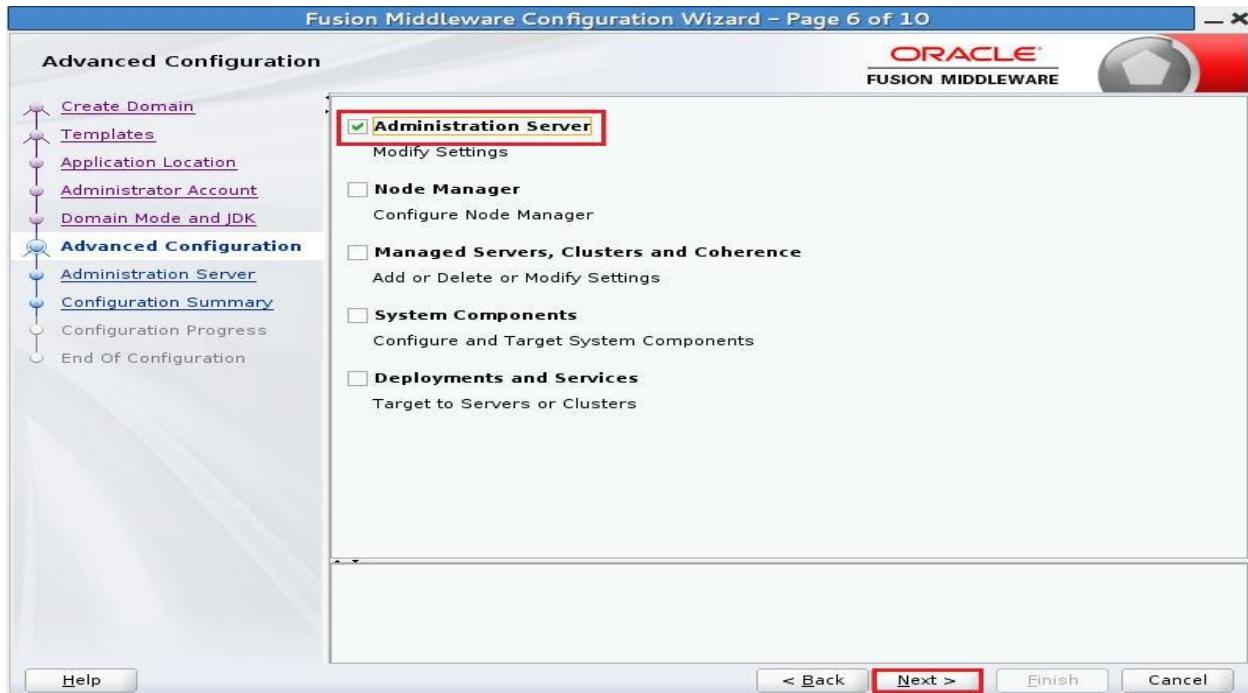

- e. Enter “**Oracle Traffic Director- Restricted JRF**” Template as it also selects other required template then Click on Next.

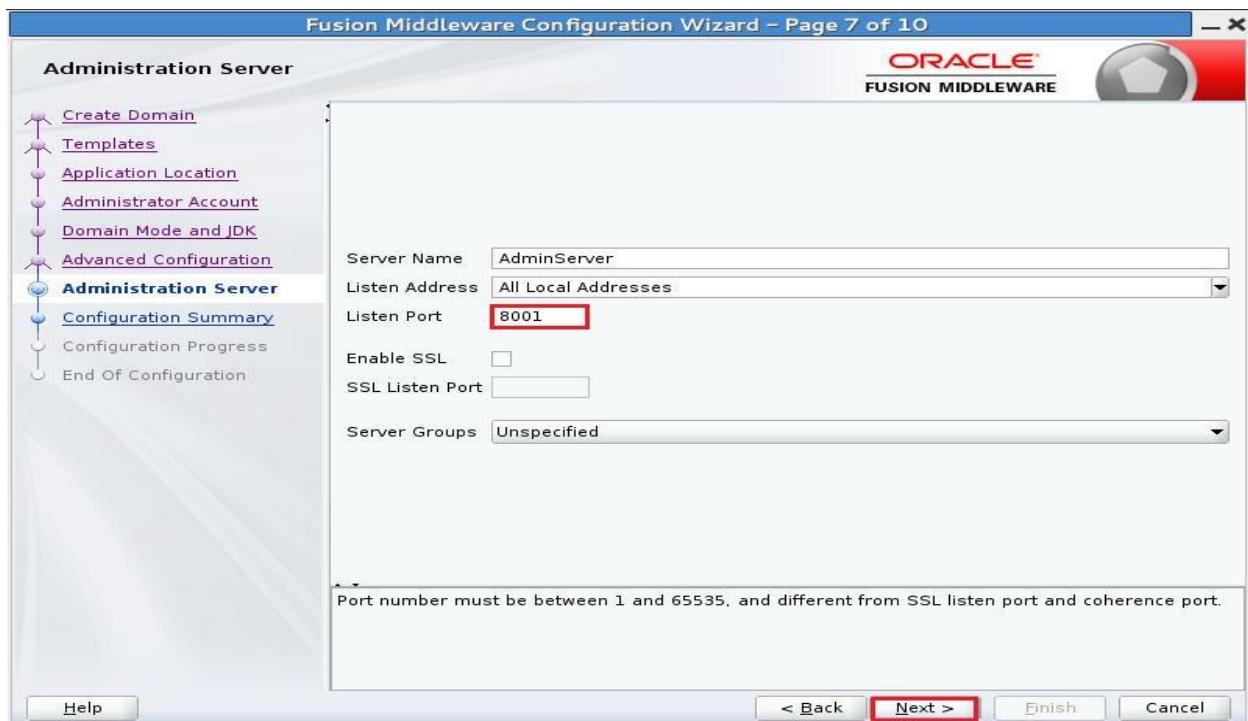

- f. Enter “/u01/wins/wls1221/user_projects/applications/otd_domain” as Application Location then Click on Next.

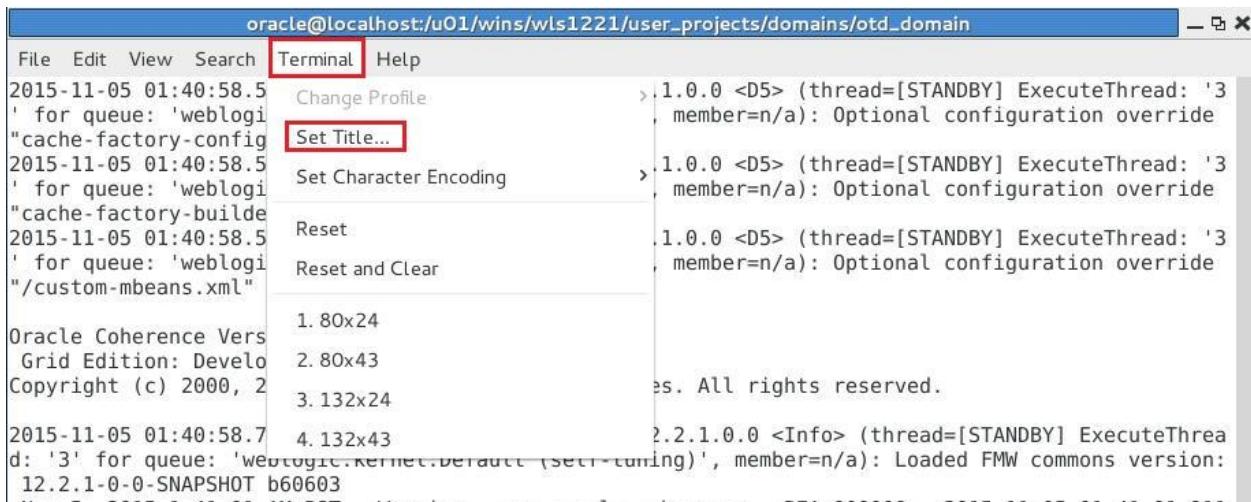

- g. Enter “**weblogic/welcome1**” as **Username/Password** then Click on Next.
- h. Leave Default in **Domain Mode and JDK** then Click on Next.
- i. In **Advanced Configuration**, Select the box near **Administration Server** then Click on Next.

- j. Change Listen port to **8001** then click on Next.

- k. Click on **Create**.
- l. Click on **Next** then Click on **Finish**.
- m. cd /u01/wins/wls1221/user_projects/domains/otd_domain/
- n. ./startWebLogic.sh
- o. In terminal, Click on **Terminal -> Set Title**. Enter **otd_admin** as Title then click on OK.

```

```

- t. bin/startNodeManager.sh
- u. In tab, Click on **Terminal -> Set Title**. Enter **otd_nm** as Title then click on OK.

- v. Go to Firefox and type the Fusion Middleware Control URL <http://localhost:8001/em> .
w. Enter “weblogic/welcome1” as Username/Password then click on Login.

- x. Create a Machine.
i. Click on WebLogic Domain ->Environment ->Machines.

Server	Machine	State
		Running

Servers 1 of 1

- ii. Click on Create, Enter “**otd_machine**” as Name and “**Unix**” as Machine OS then Click on Next.

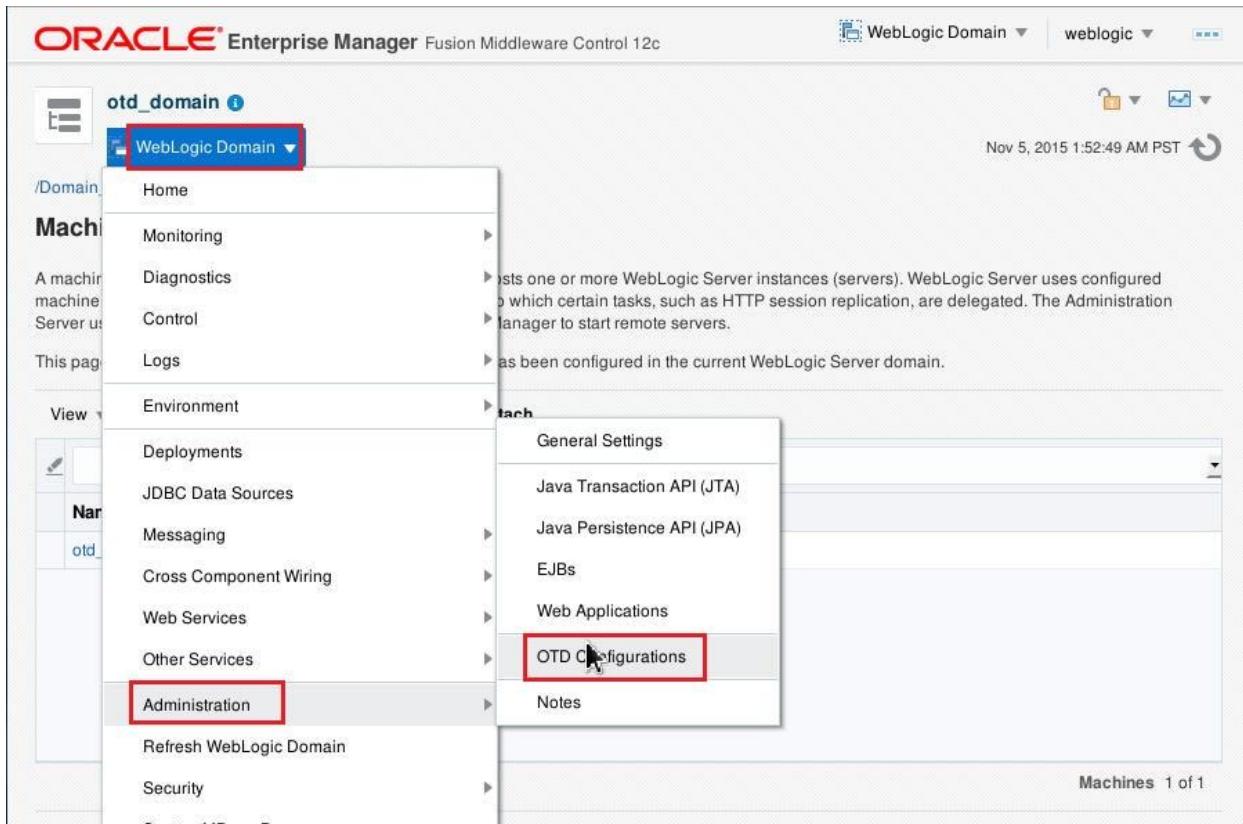

The screenshot shows the Oracle Enterprise Manager interface for creating a machine. The title bar reads "ORACLE® Enterprise Manager Fusion Middleware Control 12c". Below it, a progress bar indicates "otd_domain" with three steps: "Machine Identity" (selected), "Node Manager Properties", and "Review". The main content area is titled "Create a Machine: Machine Identity". It contains a form with two fields: "* Name" (containing "otd_machine") and "Machine OS" (set to "Unix"). A red box highlights both the "Name" field and the "Machine OS" dropdown. At the bottom right are buttons for "Back", "Step 1 of 3", "Next" (which is highlighted with a red box), "Create", and "Cancel".

- iii. Change Listen Port to **5557** then Click on Next.

The screenshot shows the Oracle Enterprise Manager interface for creating a machine, specifically the "Node Manager Properties" step. The title bar and progress bar are identical to the previous screenshot. The main content area is titled "Create a Machine: Node Manager Properties". It contains a note about configuring Node Manager for Managed Servers. Below is a section for Java-based Node Manager settings, including "Node Manager Type" (set to "SSL") and fields for "Listen Address" (set to "localhost") and "Listen Port" (set to "5557"). A red box highlights the "Listen Port" field. At the bottom right are buttons for "Back", "Step 2 of 3", "Next" (highlighted with a red box), "Create", and "Cancel".

- iv. Click on **Create**.

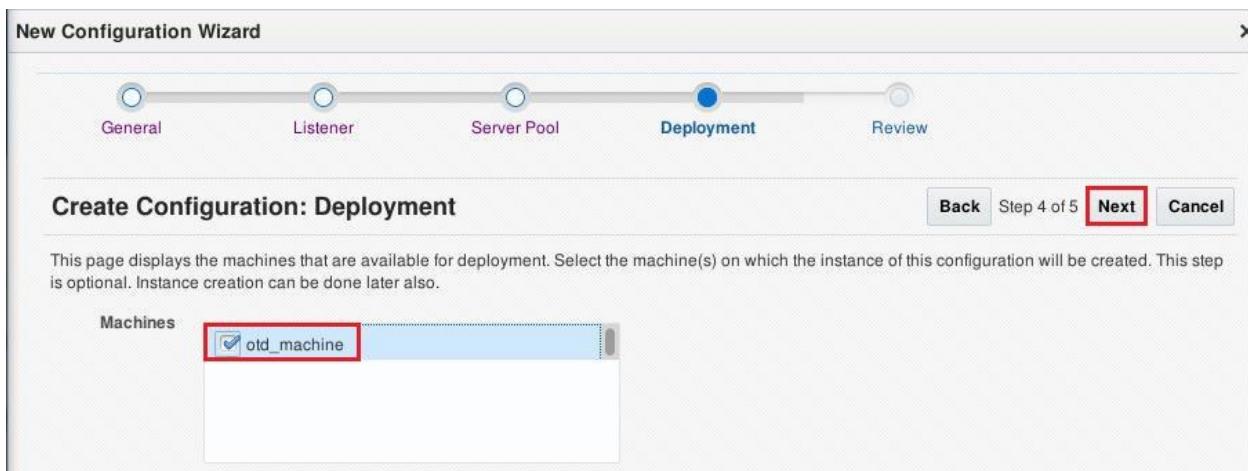

- y. Create an OTD Configuration.
- Click on **WebLogic Domain -> Administration -> OTD Configurations**.

- Click on Create.
- Enter "mt" as Name and "HTTP" as Origin Server Type then click on Next.

The screenshot shows the 'New Configuration Wizard' with five steps: General, Listener, Server Pool, Deployment, and Review. The 'General' step is active, indicated by a blue dot. The 'Create Configuration: General' form contains a note about configuration elements, a 'Name' input field with 'mt' (highlighted with a red box), and an 'Origin Server Type' section with 'HTTP' (highlighted with a red box) selected. Other options include 'TCP (Example: LDAP, T3, SSL Tunneling)'. The 'Next' button is highlighted with a red box. Navigation buttons 'Back', 'Step 1 of 5', and 'Cancel' are also visible.

- Leave Default in "Create Configuration: Listener" then click on Next.
- Leave Default in "Create Configuration: Server Pool" then click on Next.
- Select the "otd_machine" then click on Next.

- vii. Click on “Create Configuration”.
- viii. Check the box near “mt” to make it highlighted and then click on **Start Instances**. Click on Close.

WebLogic Domain ▾

i Information

Successfully created configuration "mt".

Successfully created instance(s) of configuration "mt" on machine(s) "otd_machine".
All changes have been activated.

Oracle Traffic Director Configurations

This page displays all the Oracle Traffic Director configurations. A configuration is a collection of elements that determine the run-time behavior of an Oracle Traffic Director instance. Click on 'Delete' to delete the selected configuration.

Configuration Name	Target Full Name
mt	/Domain_otd_domain/otd_domain/mt

Create... Duplicate Delete... Stop Instances Start Instances

Note: Go to Firefox and type the URL <http://localhost:8080/> to verify that server is listening.

The screenshot shows a Firefox browser window with the address bar set to 'localhost:8080'. The main content area displays a red-bordered 'Service Unavailable' header followed by the message 'The server is too busy to respond to your request. Please try again later.'

Registering an OTD Runtime Instance

- i. Go to base domain Fusion Middleware Control Console <http://localhost:7001/em>.
- ii. Enter weblogic/welcome1 as User Name/Password then click on Login.
- iii. Click on **Weblogic Domain -> Environment -> OTD Runtimes**.

The screenshot shows the Oracle Enterprise Manager Fusion Middleware Control 12c interface. The left sidebar is expanded to show 'base_domain'. Under 'WebLogic Domain', the 'Environment' link is highlighted with a red box. In the main content area, a message box says 'All changes have been activated.' Below it, the 'OTD Runtimes' link is also highlighted with a red box. A table on the right lists one entry:

ID	Replication Type	Multicast Address	Multicast Port
1	(None)	239.192.0.0	7001

At the bottom right of the table, it says 'Clusters 1 of 1'.

iv. Click on **Register Runtime**.

The screenshot shows the Oracle Enterprise Manager Fusion Middleware Control 12c interface. The top navigation bar includes 'ORACLE Enterprise Manager' and 'Fusion Middleware Control 12c'. Below it, there's a breadcrumb trail: 'base_domain' > 'WebLogic Domain'. The main content area is titled 'OTD Runtimes'. A sub-header below it states: 'Oracle Traffic Director can be used to front-end domain partitions created in this WebLogic domain. Oracle Traffic Director can be installed within this same domain or in a separate domain. OTD runtimes need to be registered with this WebLogic domain before they can be used.' A red box highlights the 'Register Runtime' button in the top right of the table header. The table has columns: Name, OTD Configuration Name, Admin Server Host, Admin Server Port, Username, and OTD Domain Name. A message at the bottom of the table says: 'No Oracle Traffic Director runtimes have been registered in this WebLogic domain.'

v. Enter the following and then click on OK.

Runtime Name:	otd_runtime
OTD Configuration Name:	mt
Admin Server Host:	localhost
Admin Server Port:	8001
Username:	weblogic
Password:	welcome1
OTD Domain Name:	otd_domain

The screenshot shows the 'Register Runtime' dialog box. The title bar says 'Register Runtime'. The instructions inside say: 'An OTD configuration will be used to front-end domain partitions. Provide the OTD configuration name and connection information (host, port and credentials) for the WebLogic Admin Server where this configuration is located.' There are seven input fields, each with a red box highlighting it: '* Runtime Name' (value: otd_runtime), '* OTD Configuration Name' (value: mt), '* Admin Server Host' (value: localhost), '* Admin Server Port' (value: 8001), '* Username' (value: weblogic), '* Password' (value: masked), and '* OTD Domain Name' (value: otd_domain). At the bottom right are 'OK' and 'Cancel' buttons, with 'OK' also having a red box around it.

Creating Domain Partition front ended by OTD

- Click on **WebLogic Domain -> Environment ->Virtual Targets**.
- Click on Create.
- Enter **VT-1** as Name and **/dp4** as Uri Prefix then click on Add to Enter **localhost** as Host Name then click on Next.

ORACLE® Enterprise Manager Fusion Middleware Control 12c

base_domain

General Targets

Create Virtual Target: General

Name * VT-1

Uri Prefix /dp4

Hosts

Specify the host name(s) that will be used for front-end access. If you are not using Oracle Traffic Director (OTD) to load balance connections for a domain partition, specify the actual host name(s) of the WebLogic server cluster or managed server. If you are using OTD to load balance connections for a domain partition, specify the host name(s) of the OTD administration server.

+ Add X Delete

Host Name

localhost

Advanced Options

Back Step 1 of 2 **Next** Cancel

- Select “app-cluster” as Cluster then click on **Create**.

ORACLE® Enterprise Manager Fusion Middleware Control 12c

Notes

Notes

Back Step 2 of 2 **Create** Cancel

- Click on **WebLogic Domain -> Environment -> Domain Partition**.
- Click on **Create**.

- g. Enter **dp4** as name and Check the box for “**Use OTD for load balancing**” and select “**otd_runtime**” then click on Next.

Create Domain Partition: General

Use this page to specify general attributes for this domain partition.

* Name: dp4

Security Realm: None

Primary Identity Domain:

Load Balancer Configuration

If you wish to use a load balancer to front-end this domain partition, choose an Oracle Traffic Director runtime from the list of registered runtimes shown below. If you wish to register a new OTD runtime, please use the Environment->OTD Runtimes menu item on the WebLogic Domain menu.

Use OTD for load balancing

OTD Runtime: otd_runtime

- h. Check the box for “VT-1” as shown below then click on Next.

Create Domain Partition: Available Targets

Select the virtual targets that will be available for this domain partition to use. Note that virtual targets can only be used by one partition; so, only available virtual targets are listed below.

Select	Virtual Target	Set as Default
<input checked="" type="checkbox"/>	VT-1	<input checked="" type="checkbox"/>

- i. Enter **app4RG** as Resource Group Name and Move **VT-1** to **Selected Targets** then click on Next.

Create Domain Partition: Resource Group

A resource group needs to be created within a partition before you can deploy applications or resources. The resource group can optionally extend a resource group template specified at the domain level.

* Resource Group Name: app4RG

Resource Group Template: None

Targets for the Resource Group: Select a target for the resource group from the list of available targets. If the partition has a default target specified, the resource group will implicitly inherit that target.

Available Targets	Selected Targets
	VT-1

- j. Review the Configuration then click on **Create**.
k. Check box near to **dp4** and click on **Control -> Start**. Click on Close.

base_domain

Deploying simple application to test OTD integration with weblogic

Here we are going to deploy heapApp.war which we used in Lab5. We will access that application through **load balancer** now.

- a. Click on dp4.
- b. Click on **Domain Partition -> Administration -> Resource Groups**.
- c. Click on Resource Group **app4RG**.
- d. Click on **Deployments** tab, and then click on **Deployment -> Deploy**.

The screenshot shows the Oracle Enterprise Manager interface for a WebLogic Domain. The top navigation bar includes 'WebLogic Domain' and 'weblogic'. Below the navigation is a toolbar with icons for 'Start Up' and 'Shut Down'. The main content area displays the path '/Domain_base_domain/base_domain/dp4 > Resource Groups > Resource Group : app4RG'. The title 'Resource Group : app4RG' is shown, followed by a table header with columns: Name, Status, State, Health, and Type. A message states 'No deployments found. Select a deployment plan or redeploy an existing application, resource adapters, and libraries.' Below the table are buttons for 'Redeploy', 'Undeploy', and 'Fetch Deployment Plan'. The 'Deploy' button in the toolbar is highlighted with a red box. The 'Deployments' tab is also highlighted with a red box.

- e. Select “Archive or exploded directory is on the server where Enterprise Manager is running” then click on **Browse**. Select the file **ScrabbleStage.war** from **/u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/Lab6/** location then click on **OK**.

Zero Downtime Patching Demo - Scrabble Example - Stage Mode - Version 1

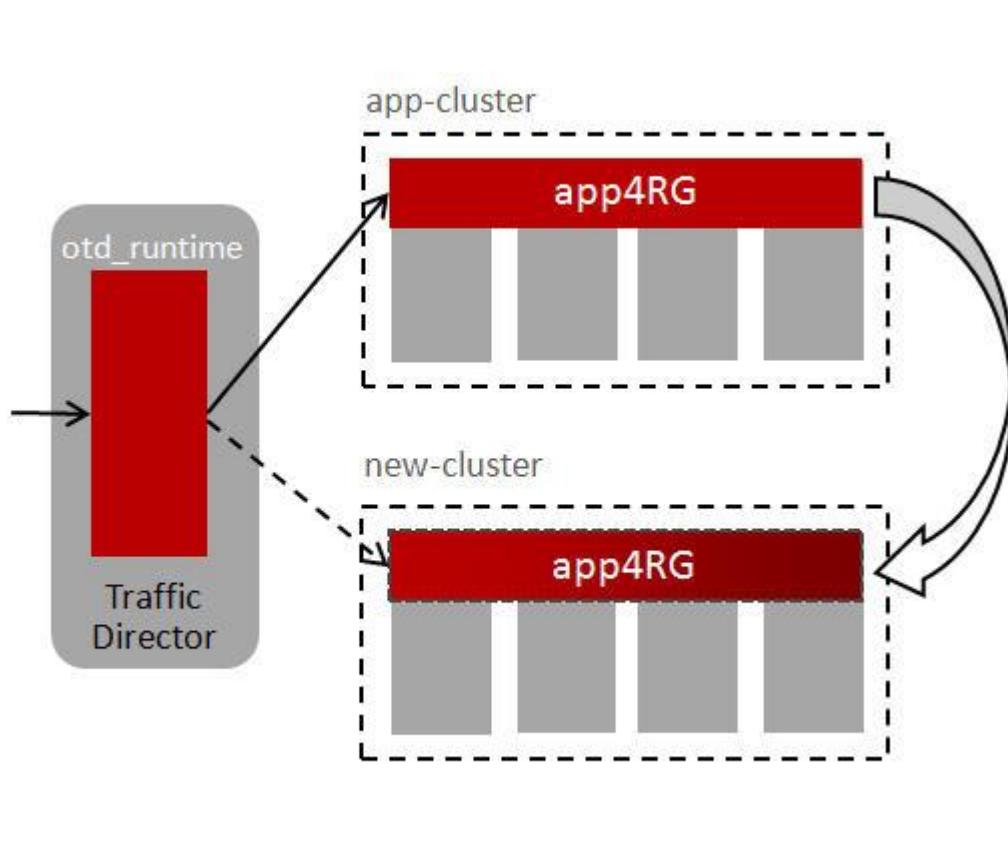

Illustrating session replication and continuous serviceability

This Zero Downtime Patching Demo uses a JSP to demonstrate the use of replication of a session in memory, using an OTD load balancer front end. An end-user client adds or deletes words to a session. The words are scored according to the rules of a popular board game and then displayed in the table. Server affinity allows WebLogic Server to retrieve the same session the next time the client visits the page.

The server currently hosting this session is app-cluster-2 (WebLogic Server 12.2.1.0.0 Tue Oct 6 10:05:47 PDT 2015 1721936)

Migration Resource Group from one Cluster to other Cluster

Now we are going to migrate Resource Group app4RG from app-cluster to another cluster. As the application deployed in app4RG are front ended by OTD, when you migrate your resource group on other cluster. WebLogic automatically detect the server setting and you can access the application continuously without doing any manual configuration.

- When you click on **migrate** the following actions performs:
- Migrate API is called
- Resource Group starts on new hosts
- Sessions are replicated to new hosts.
- New origin server pool added to the OTD Configuration
 - Old pool used for sticky request to old pool only
 - New pool used for all new requests.
- Graceful shutdown called on resource group on original hosts.
- Virtual target configuration updated with new cluster only.

So using the same URL, you can access the application.

- a. Go back to Fusion middleware control console <http://localhost:7001/em>
- b. Create a new Cluster.
 - i. Click on **WebLogic Domain -> Environment -> Clusters**.
 - ii. Click on **Create -> Dynamic Cluster**.
 - iii. Enter **new-cluster** as Name then click on Next.
 - iv. Enter 1 as Dynamic Cluster Size then click on Next.
 - v. Select the box for "**Use a single machine for all dynamic servers**" and choose "**machine**" as Selected Machine then click on Next.
 - vi. Enter 9100 and 10101 as **Base Listen Port** and **SSL Base Listen Port** Respectively then click on Next.
 - vii. Review the Configuration then click on **Create**.
 - viii. Click on **WebLogic Domain -> Control -> Clusters**.
 - ix. Check the box near **new-cluster** to make it highlighted and then click on **Control -> Start -> Start Servers**.

Note: Before going to next step, wait till managed server in new-cluster get started, you can monitor the progress in base_nm tab.

- c. Migration of Resource Group.
 - i. Click on **WebLogic Domain -> Environment -> Resource Groups..**
 - ii. Check the box near to app4RG to make it highlighted and then click on Migrate. Select **new-cluster** as New Target then click on Migrate. In Confirmation window, click on Migrate.
 - iii. Once you notice "**Migrating resource group "app4RG" – Completed successfully**" message then click on Close.

The screenshot shows the Oracle Enterprise Manager interface for Fusion Middleware Control 12c. The main window displays a 'Resource Group Migration' dialog. On the left, a sidebar lists resource groups: app2RG, app3RG, app4RG (highlighted with a red box), and appRG. The migration dialog shows the following details:

- Resource Group:** app4RG
- Virtual Target:** VT-1
- Current Target:** app-cluster (Cluster)
- New Target:** new-cluster (Dynamic cluster) (highlighted with a red box)

A confirmation dialog box is overlaid on the main window, stating:

Confirmation

Migrating resource group "app4RG" - Completed Successfully

The virtual target "VT-1", to which this resource group is targeted to, has been migrated from "app-cluster (Cluster)" to "new-cluster (Dynamic cluster)"

Buttons in the confirmation dialog include **Close**, **Migrate** (highlighted with a red box), and **Cancel**.

At the bottom of the main window, status bars show "Rows Selected 1" and "Resource Groups 4 of 4".

Access Application through OTD

- Go to Firefox and type the URL <http://localhost:8080/dp4/ScrabbleStage/Scrabble.jsp>.

The screenshot shows a Firefox browser window with the URL localhost:8080/dp4/ScrabbleStage/Scrabble.jsp in the address bar. The page content includes the ORACLE logo, the title "Zero Downtime Patching Demo - Scrabble Example - Stage Mode - Version 1", and a subtitle "Illustrating session replication and continuous serviceability". A note below states: "This Zero Downtime Patching Demo uses a JSP to demonstrate the use of replication of a session in memory, using an OTD load balancer front end. An end-user client adds or deletes words to a session. The words are scored according to the rules of a popular board game and then displayed in the table. Server affinity allows WebLogic Server to retrieve the same session the next time the client visits the page." At the bottom, it says "The server currently hosting this session is new-cluster-1 (WebLogic Server 12.2.1.0.0 Tue Oct 6 10:05:47 PDT 2015 1721936)".

- As the Resource group migrated from app-cluster to new-cluster. But still you are able to access the application through same URL. Load balancer is redirecting all requests to new cluster. new-cluster-1 is running on 9101 port and app-cluster-2 is running on 7102.

The screenshot shows a Firefox browser window with the URL localhost:7102/dp4/ScrabbleStage/Scrabble.jsp in the address bar. The page title is "Error 404--Not Found". Below it, a section titled "From RFC 2068 Hypertext Transfer Protocol -- HTTP/1.1:" contains the definition of the 404 status code: "10.4.5 404 Not Found". It states: "The server has not found anything matching the Request-URI. No indication is given of whether the condition is temporary or permanent." It also notes: "If the server does not wish to make this information available to the client, the status code 403 (Forbidden) can be used instead. The 410 (Gone) status code SHOULD be used if the server knows, through some internally configurable mechanism, that an old resource is permanently unavailable and has no forwarding address."

The screenshot shows a Firefox browser window with the following details:

- Address Bar:** localhost:9101/dp4/ScrabbleStage/Scrabble.jsp
- Toolbar:** Oracle Technology Ne..., Applications, Admin Console, Developer Producti..., Technical Innovation, Operations
- Content Area:**
 - ORACLE logo:**
 - Section Header:** Zero Downtime Patching Demo - Scrabble Example - Stage Mode - Version 1
 - Text:** Illustrating session replication and continuous serviceability
 - Description:** This Zero Downtime Patching Demo uses a JSP to demonstrate the use of replication of a session in memory, using an OTD load balancer front end. An end-user client adds or deletes words to a session. The words are scored according to the rules of a popular board game and then displayed in the table. Server affinity allows WebLogic Server to retrieve the same session the next time the client visits the page.
 - Information:** The server currently hosting this session is new-cluster-1 (WebLogic Server 12.2.1.0.0 Tue Oct 6 10:05:47 PDT 2015 1721936)

So you can successfully migrate the resource group from one cluster to another cluster without affecting the front end of your application.

CLEANING AND RESETTING

Cleaning up Environment

- Go back to Fusion Middleware Control <http://localhost:7001/em>
- Click on WebLogic Domain -> Control -> Cluster.
- Check the boxes near to both the cluster then click on Control -> Shutdown -> Force Shutdown now. Click on Forcibly Shutdown Servers.

ORACLE® Enterprise Manager Fusion Middleware Control 12c

- d. Press CTRL + C on Tab title with otd_admin, otd_nm, base_nm, base_admin, dev_admin, app-cluster-1.
- e. Open a new terminal.
- f. cd /u01/content/weblogic-innovation-seminars/WInS_Demos/MT-Workshop/CleanUp/
- g. ./CleanEnvironment.sh

Appendix:

This Section is to provide you help, if you already run this workshop once, and only interested to showcase any specific features or any specific lab. We created few scripts about which the description is given below.

Lab1-2.sh: It starts the DB, and create user and populates the DB for all domain partition we need. Then it create the base_domain, in that domain we create the machine and dynamic cluster. After that we create three domain partition dp1, dp2 and dp3. Basically after execution of this script, you will be at the end of Lab 2.

Note: After executing Lab1-2.sh, if you want to see proper metrics/state of cluster/servers you need to manually apply JRF template to cluster. You need to restart the cluster as well.

Lab3.sh: This script stop the domain partition dp1 and create new security realm newrealm and assign this security realm to dp1, and start the domain partition dp1. It perform the same task what Lab 3 does.

Lab4.sh: This script creates dev_domain, it configures the Medrec application in Medrec-Dev domain partition in dev_domain, and then it removes the dp1 in base_domain. So you can login to admin console of dev_domain and export the partition and later import it in base_domain through admin console.

Lab5.sh: It sets the configuration parameter for RCM in SetDomainEnv.sh script then it restart the cluster and also deploys heapApp.war in dp2 partition in base_domain.

Lab6.sh: This script creates otd_domain first, inside otd_domain; it creates otd_machine and OTD Configuration. Then it creates load balancer instance and start it. Then in base_domain, it creates the Virtual target VT-1, and registers OTD Runtime, after that it creates domain partition dp4 with otd_runtime and then deploy the heapApp.war in app4RG resource group inside dp4 partition. It also create new-cluster dynamic cluster, and start domain partition dp4 and server in new-cluster. After running this script, you can move to resource group app4RG in dp4 in FMW console, and migrate the resource group.

CleanEnvironment.sh: This script stops the servers and Node managers, remove the otd_domain, base_domain, dev_domain. It also removes the user from pluggable database, and then it stops the DB.
